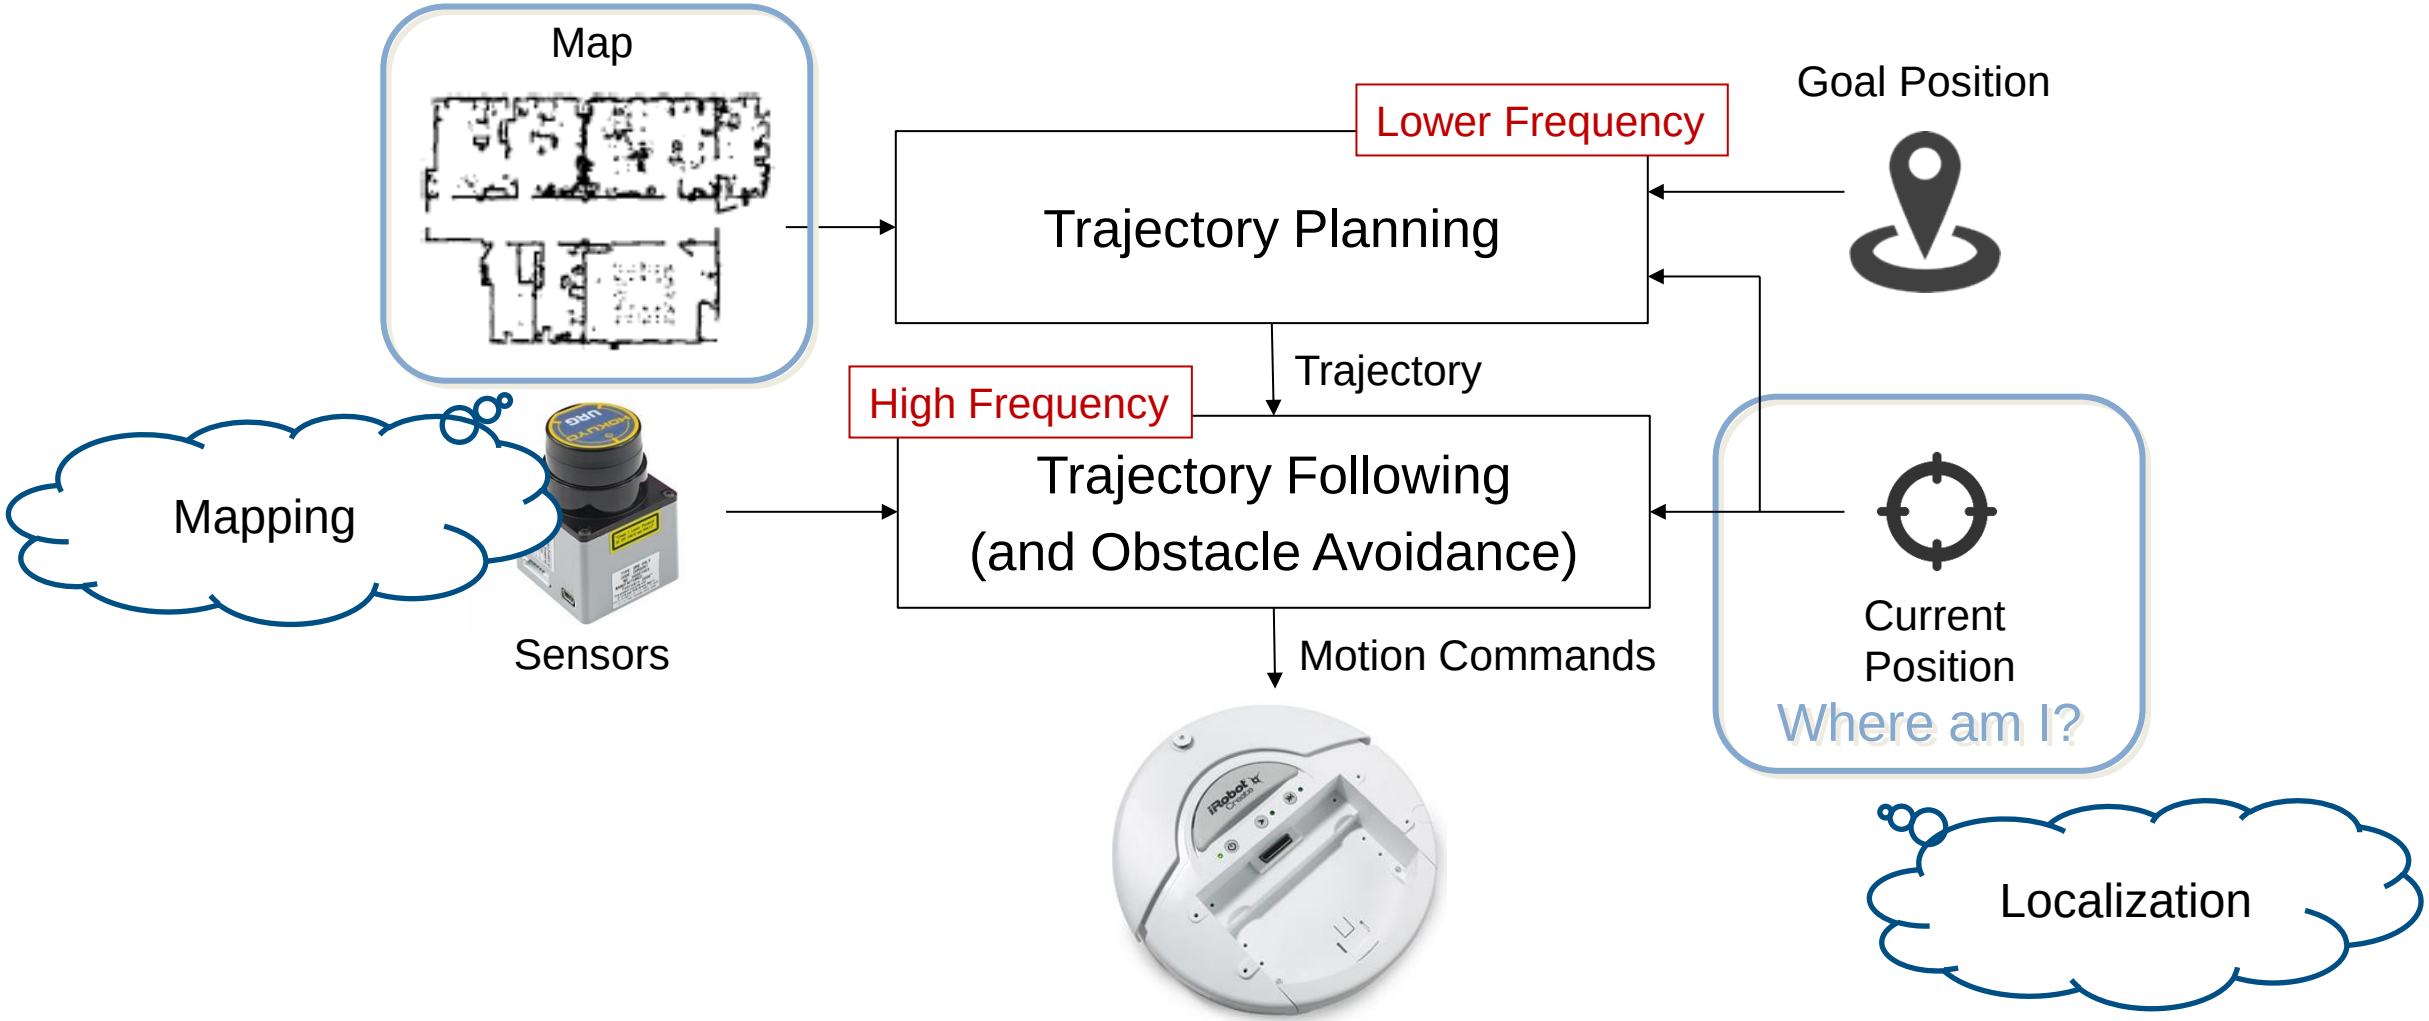
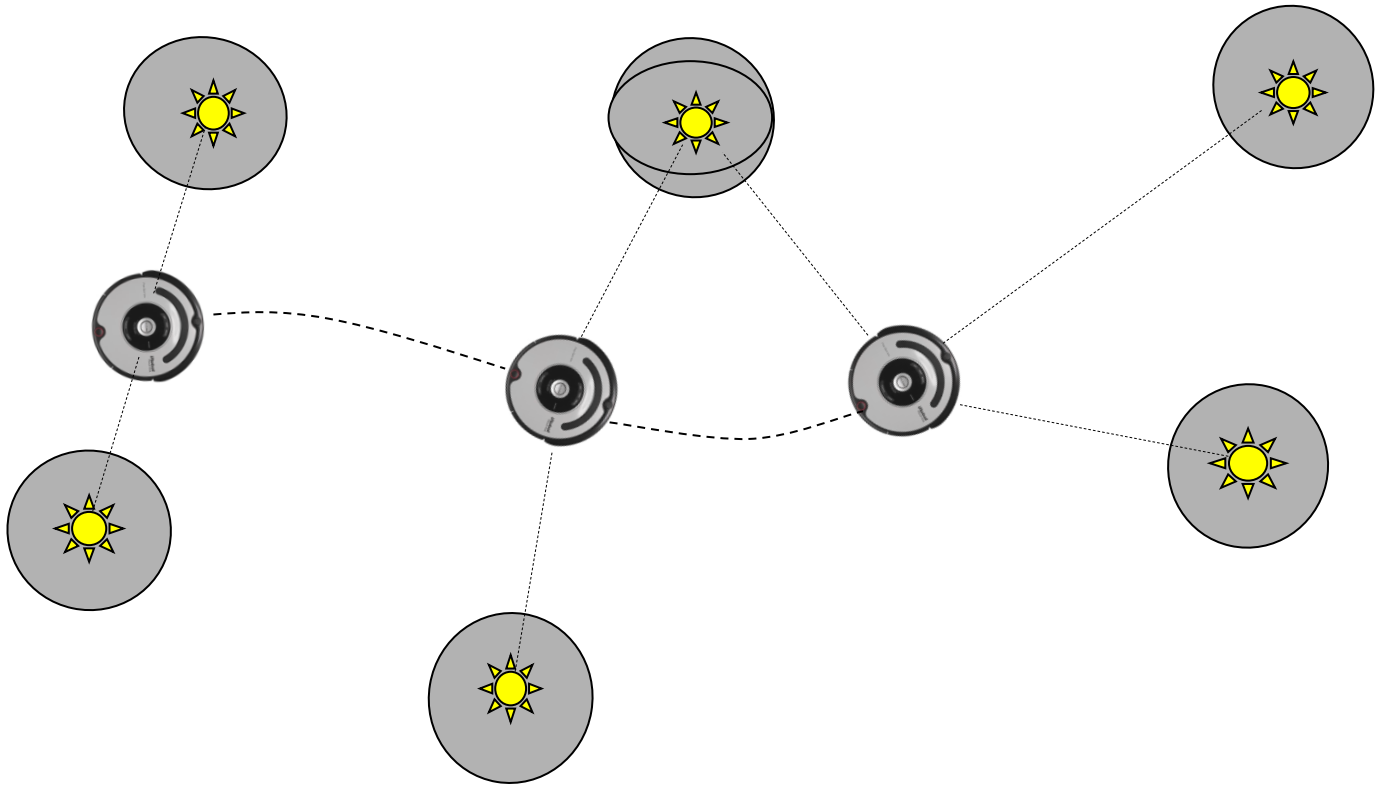
Artificial Intelligence and Robotics Lab - Politecnico di Milano

A Simplified Sense-Plan-Act Architecture

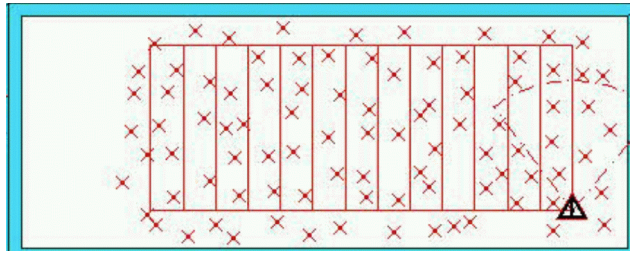


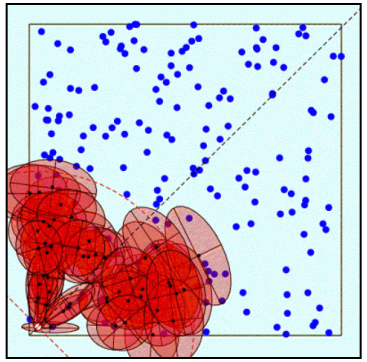
Mapping with Known Poses

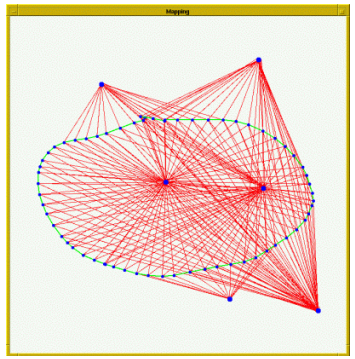


Representations

Landmark-based

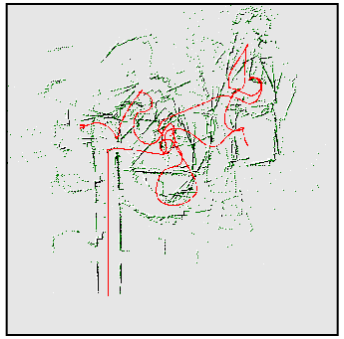


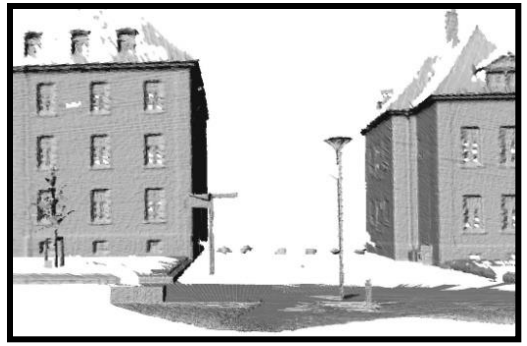


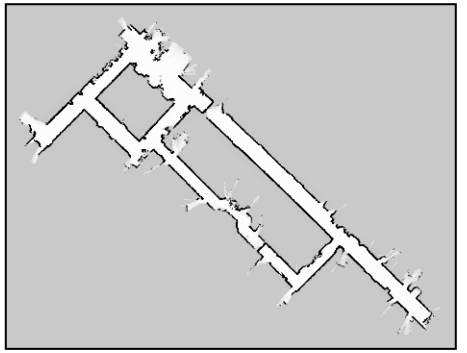


[Leonard et al., 98; Castelanos et al., 99: Dissanayake et al., 2001; Montemerlo et al., 2002;…]

Grid maps or scans





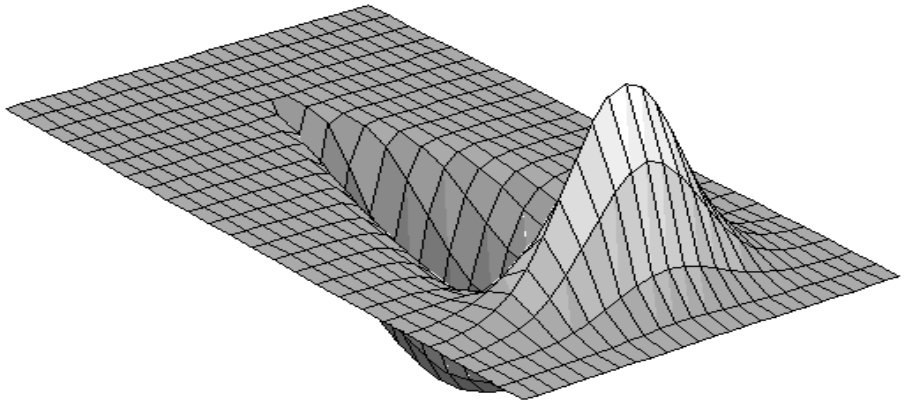


[Lu & Milios, 97; Gutmann, 98: Thrun 98; Burgard, 99; Konolige & al., 00; Thrun, 00; Arras, 99; Haehnel, 01;…]

Occupancy from Sonar Return (the origins)

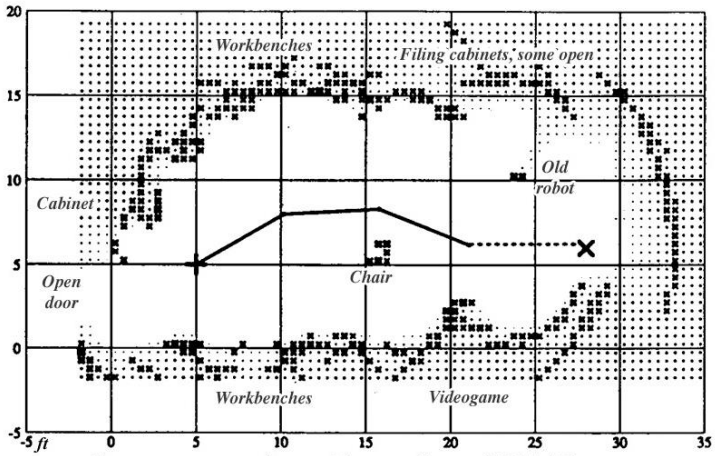
The most simple occupancy model used sonars

- A 2D Gaussian for information about occupancy
- Another 2D Gaussian for free space



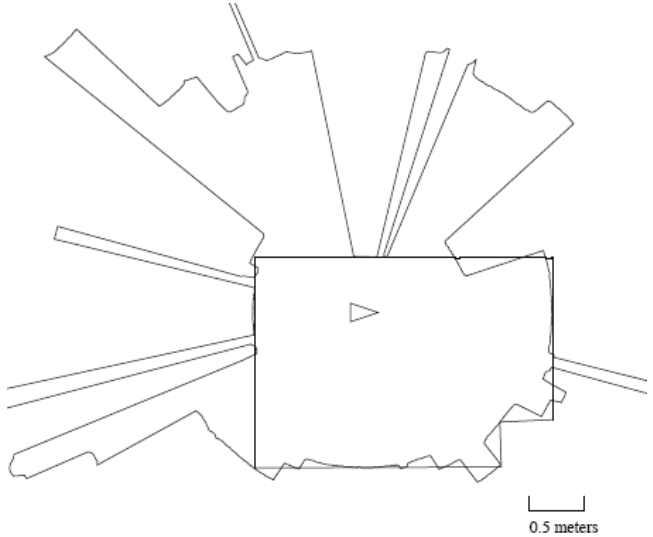
Sonar sensors present several issues

- A wide sonar cone creates noisy maps
- Specular (multi-path) reflections generates unrealistic measurements



Room traverse by grid map from SONAR

Moravec 1984

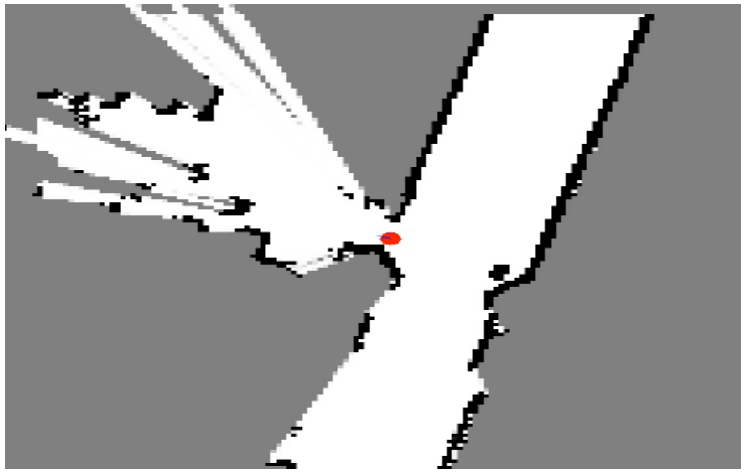


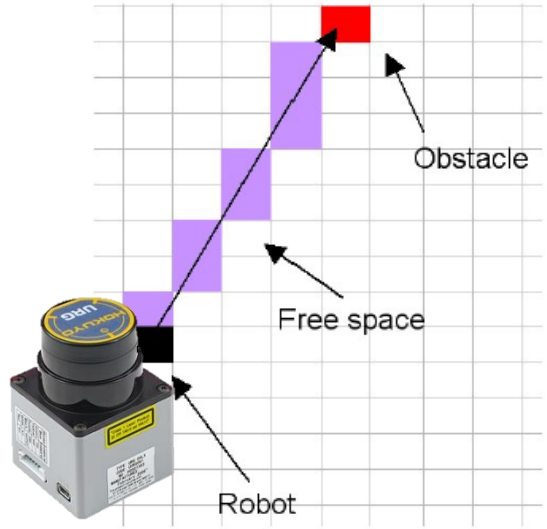
2D Occupancy Grids

A simple 2D representation for maps

- Maps the environment as an array of cells
- Usual cell size 5 to 50cm
- Each cells holds the probability of the cell to be occupied
- Useful to combine different sensor scans from different sensors (e.g., sonar + lidar)
- Each cell is assumed independent
- Probability of a cell of being occupied updated using Bayes theorem

$$P(A|B) = \frac{P(B|A)P(A)}{P(B|A)P(A) + P(B|\sim A)P(\sim A)}$$





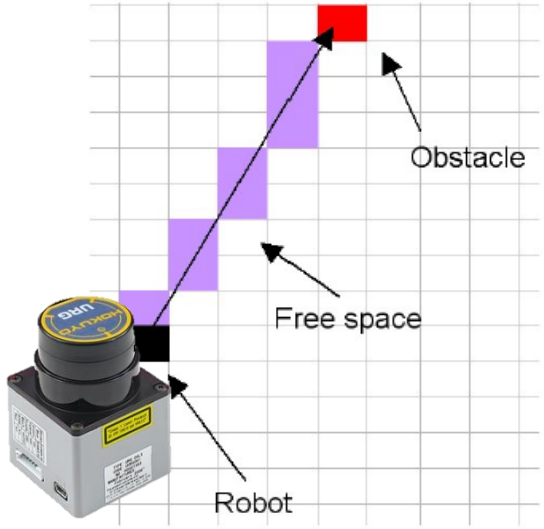
Occupancy Grid Cell Update (log odds)

Let $occ(i,j)$ mean cell C_{ij} is occupied, we have

- Probability: $\mathrm{P}(occ(i,j))$ has range $[0,1]$
- Odds: $\mathrm{odd}(occ(i,j))$ has range $[0,\infty]$

$$\mathrm{odd}\big(occ(i,j)\big) = \mathrm{P}(occ(i,j))/\mathrm{P}(\neg occ(i,j))$$

- Log odds: $\log \mathrm{odds}(occ(i,j))$ has range $[-\infty,\infty]$



Each cell C_{ij} holds the value $\log \mathrm{odds}(occ(i,j))$, $C_{ij} = 0$ corresponds to $\mathrm{P}\big(occ(i,j)\big) = 0.5$

Cells are updated recursively by applying the Bayes theorem

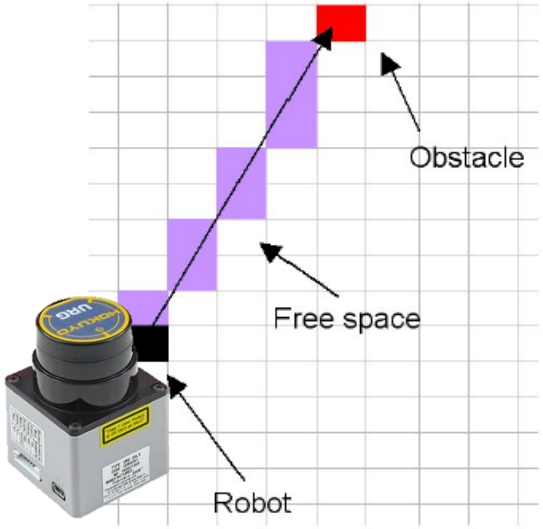
- $A = occ(i,j)$
- $B = measure(i,j)$

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

Occupancy Grid Cell Update (log odds)

- $A = occ(i,j) = o_{ij}$
- $B = measure(i,j) = m_{ij}$

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$



To update current odds based on a measurement

$$odd(o_{ij}|m_{ij}) = \frac{P(o_{ij}|m_{ij})}{P(\neg o_{ij}|m_{ij})} = \frac{P(m_{ij}|o_{ij})P(o_{ij})/P(m_{ij})}{P(m_{ij}|\neg o_{ij})P(\neg o_{ij})/P(m_{ij})} = \frac{P(m_{ij}|o_{ij})P(o_{ij})}{P(m_{ij}|\neg o_{ij})P(\neg o_{ij})}$$

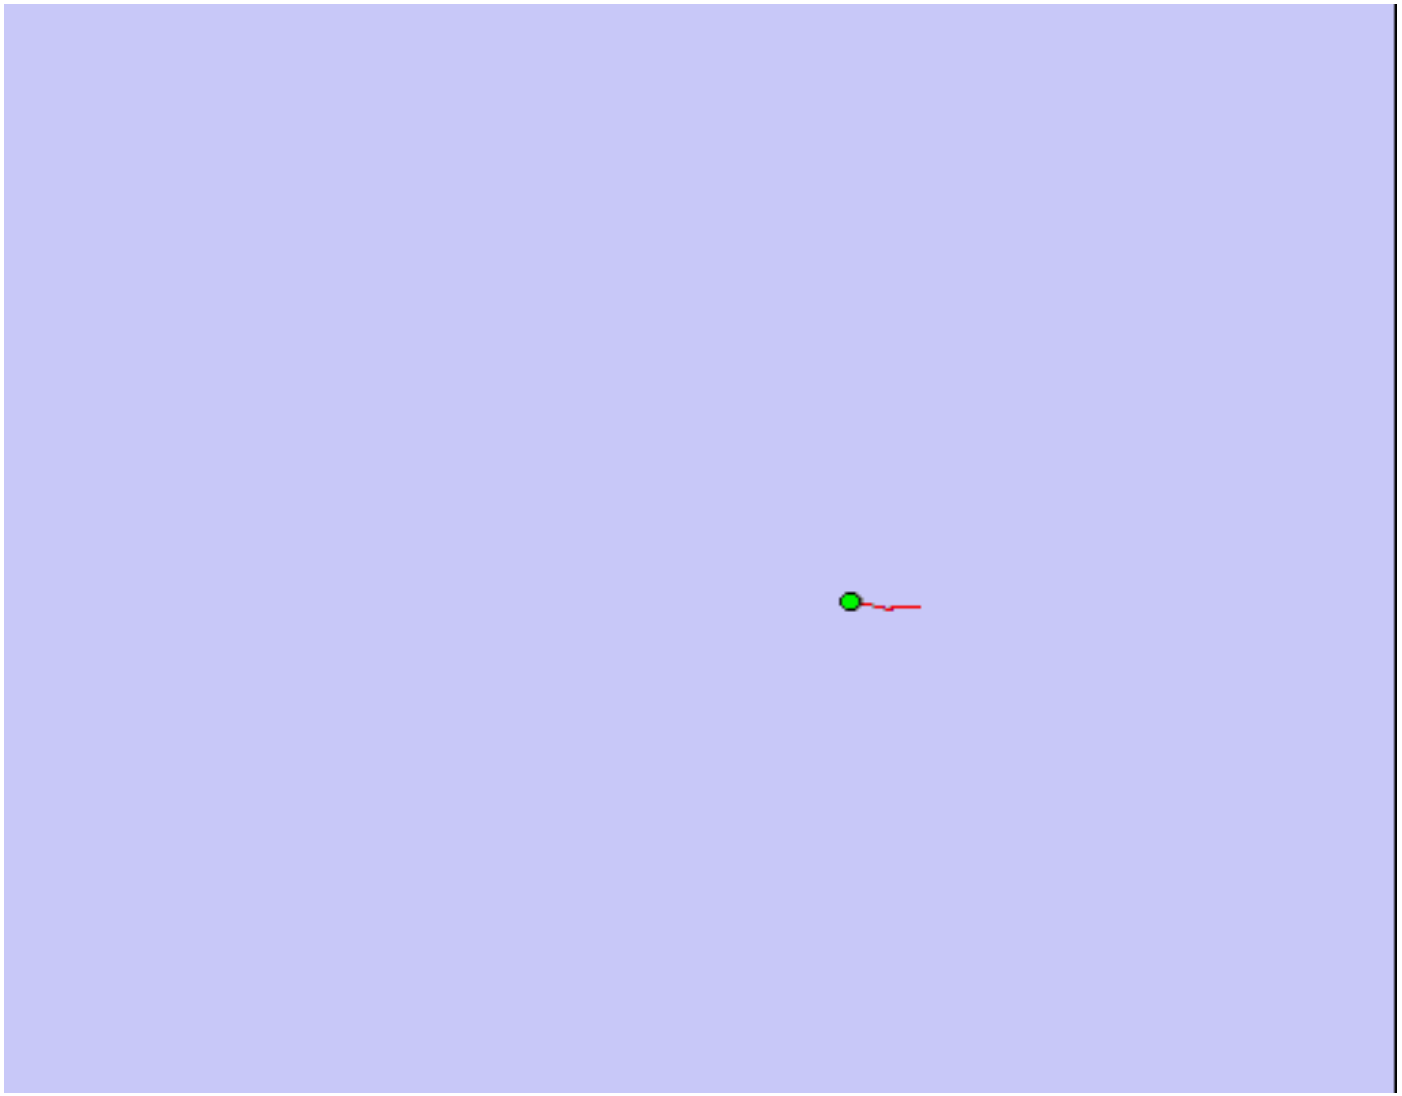
Taking logarithms

$$logodd(o_{ij}|m_{ij}) = log\frac{P(m_{ij}|o_{ij})P(o_{ij})}{P(m_{ij}|\neg o_{ij})P(\neg o_{ij})} = log\frac{P(m_{ij}|o_{ij})}{P(m_{ij}|\neg o_{ij})} + log\frac{P(o_{ij})}{P(\neg o_{ij})}$$

Ratio between measurement likelihoods

Log odds before measurement

Mapping with Raw Odometry (assuming known poses)



Scan Matching

$\hat{x}^{[t]}$ Correct odometry by maximizing the likelihood of pose *t* based on the estimates of pose and map at time *t-1*.

$$\hat{x}_t = \arg\max_{x_t} \left\{ p(z_t \mid x_t, \hat{m}^{[t-1]}) \cdot p(x_t \mid u_{t-1}, \hat{x}_{t-1}) \right\}$$

current measurement

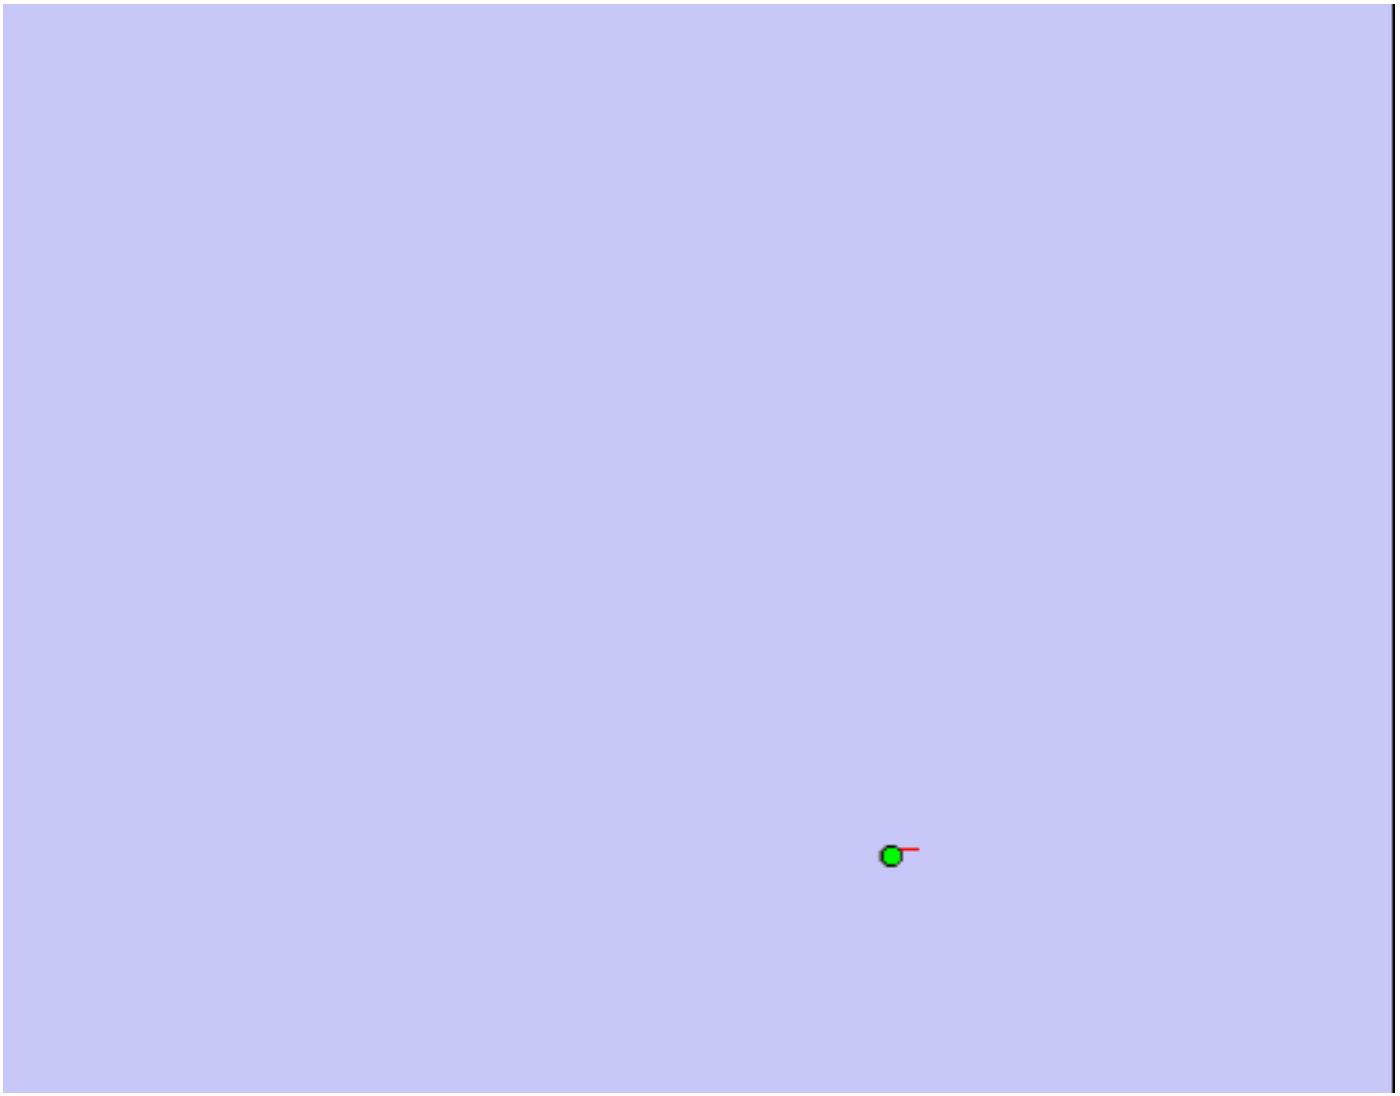
map constructed so far

robot motion

$\hat{m}^{[t]}$ Then compute the map $\hat{m}^{[t]}$ according to "mapping with known poses" based on the new pose and current observations.

Alternate the two steps of localization and mapping …

Scan Matching Example



Scan Matching

$\hat{x}^{[t]}$ Correct odometry by maximizing the likelihood of pose *t* based on the estimates of pose and map at time *t-1*.

$$\hat{x}_t = \arg\max_{x_t} \left\{ p(z_t \mid x_t, \hat{m}^{[t-1]}) \cdot p(x_t \mid u_{t-1}, \hat{x}_{t-1}) \right\}$$

Does not keep track of the uncertainty in the process

current mea… …motion

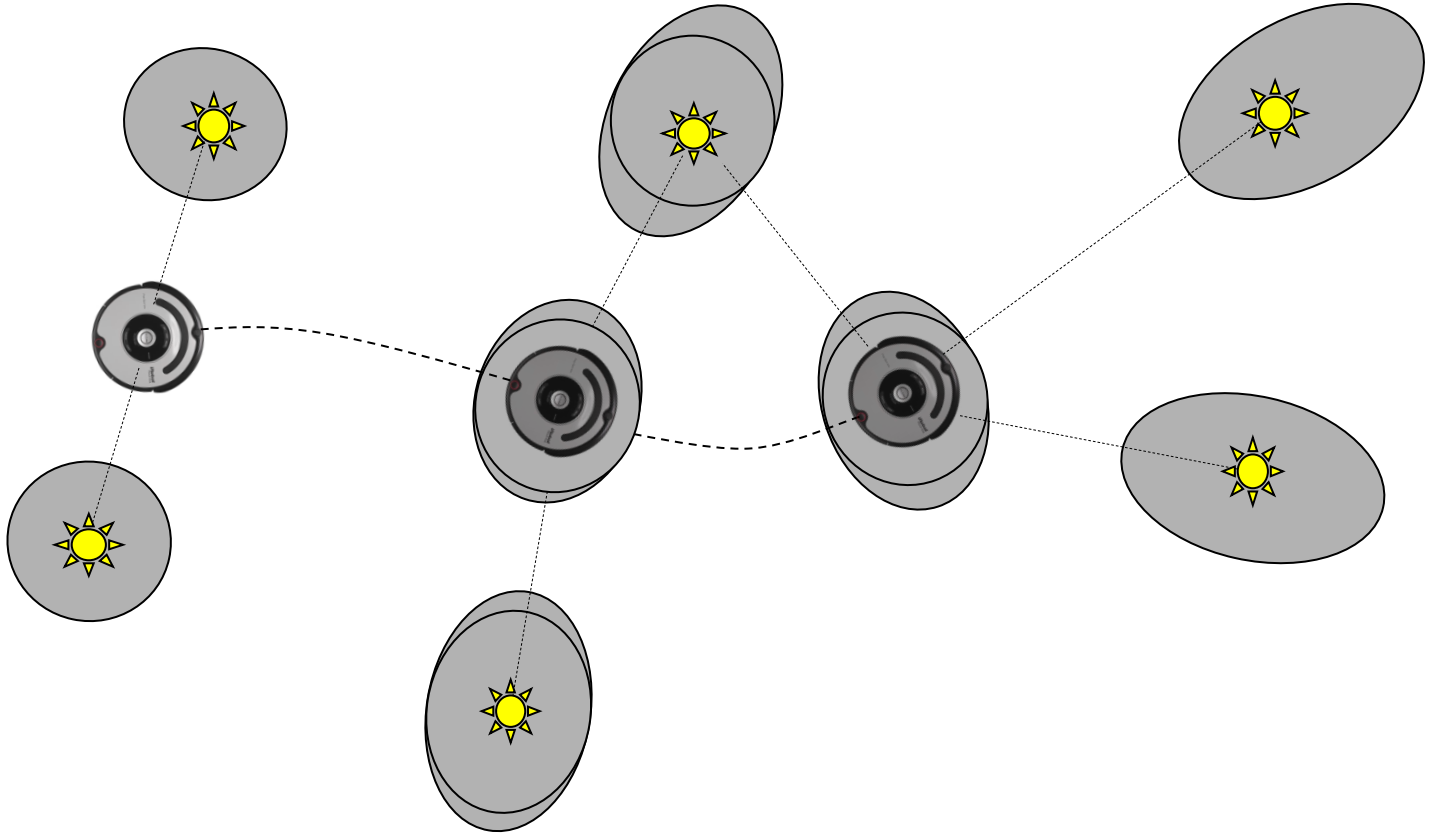
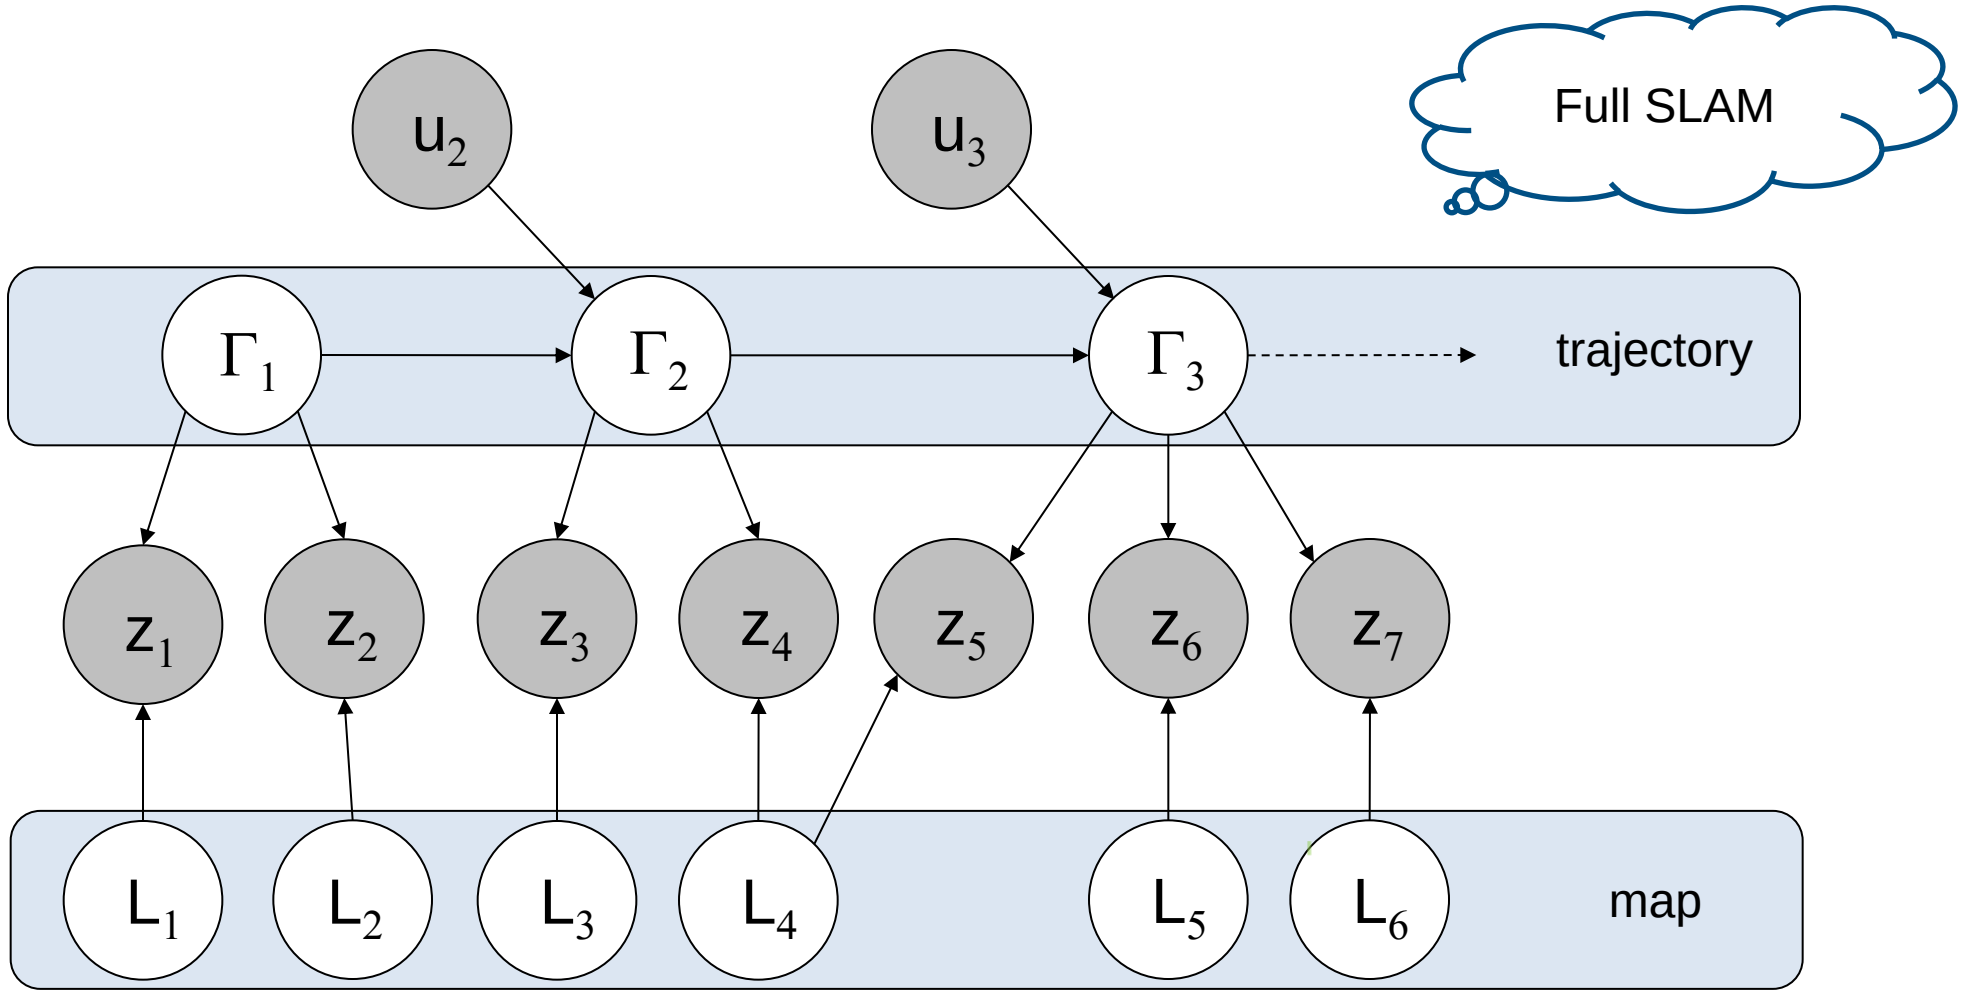
Simultaneous Localization and Mapping (SLAM)

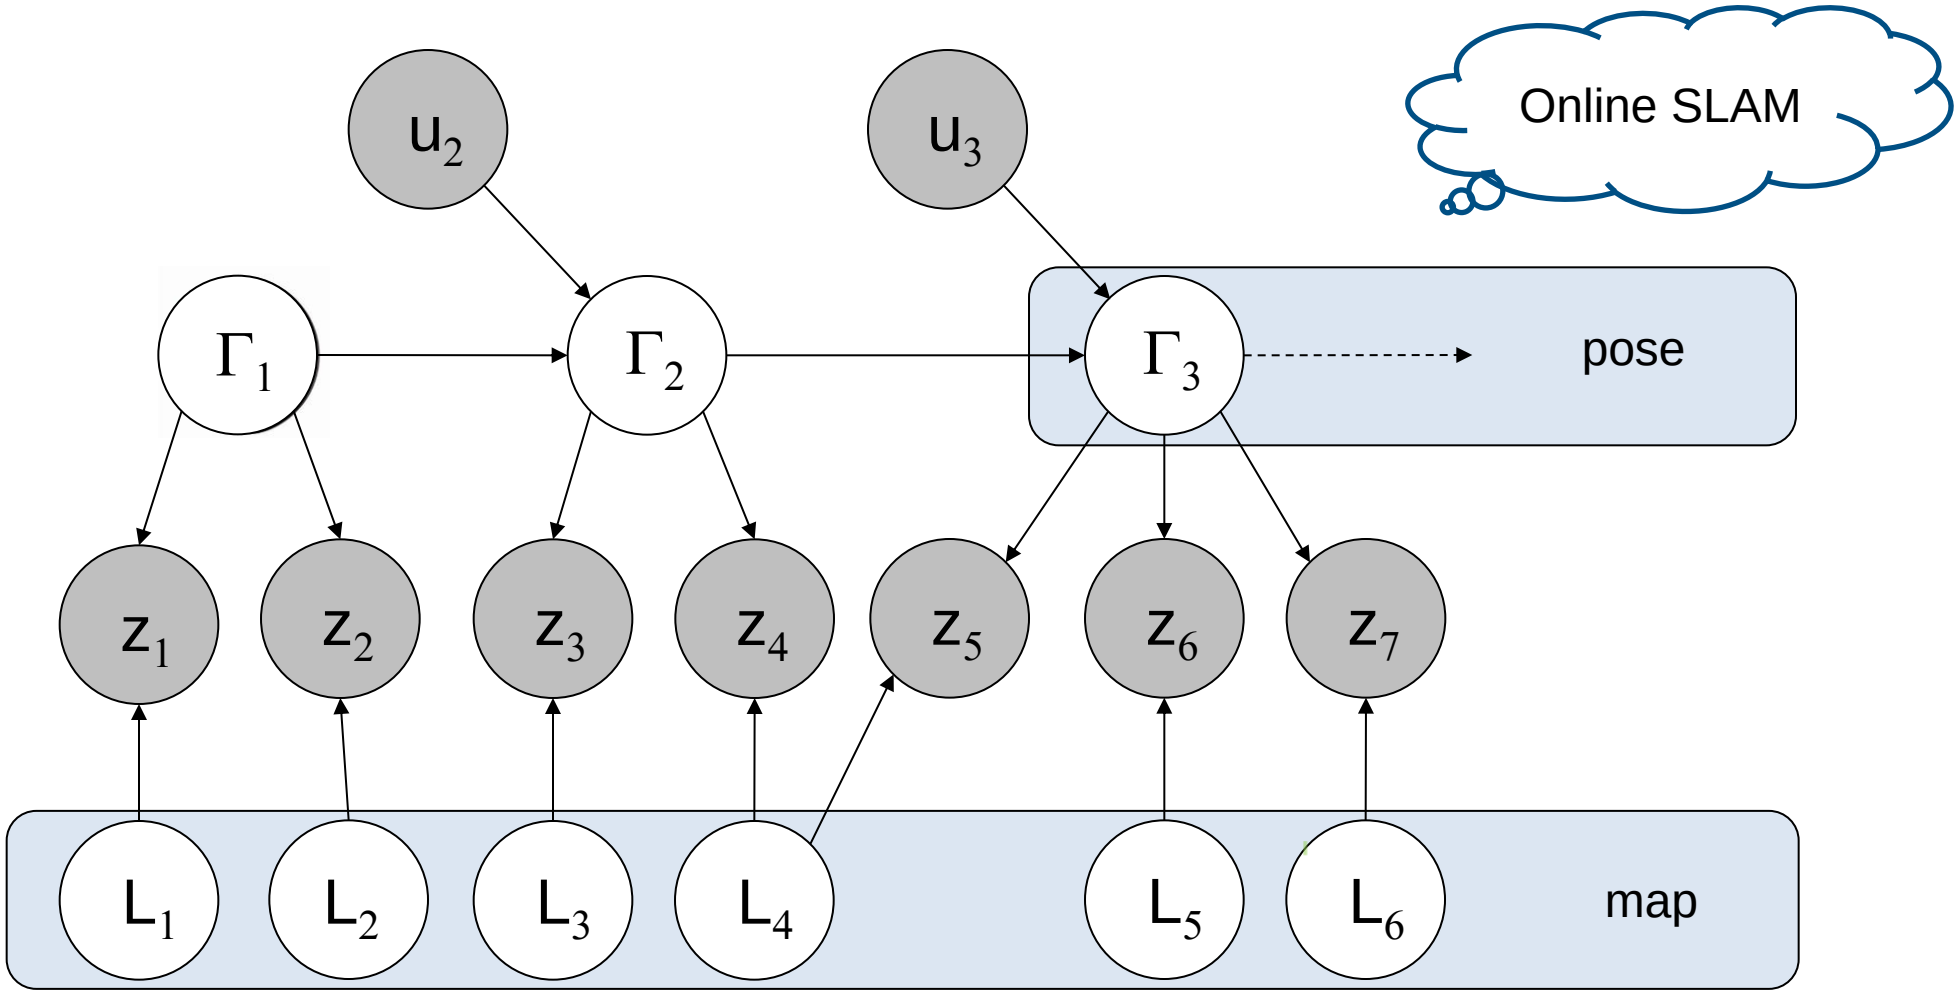


Dynamic Bayesian Networks and Full SLAM



Smoothing: $p(\Gamma_{1:t}, L_1, \ldots, L_N | Z_{1:t}, U_{1:t})$

Dynamic Bayesian Networks and Online SLAM



Filtering: $p(\Gamma_t, L_1, \dots, L_N | Z_{1:t}, U_{1:t})$

SLAM: Simultaneous Localization and Mapping

Full SLAM: $p(x_{1:t}, m \mid z_{1:t}, u_{1:t})$

Simultaneous estimate of path and map

Integrals computed one at the time

Online SLAM: $p(x_t, m \mid z_{1:t}, u_{1:t}) = \int\int \ldots \int p(x_{1:t}, m \mid z_{1:t}, u_{1:t})\, dx_1 dx_2 \ldots dx_{t-1}$

Simultaneous estimate of most recent pose and map

SLAM: Simultaneous Localization and Mapping

Full SLAM: $p(x_{1:t}, m \mid z_{1:t}, u_{1:t})$

Online SLAM: p ... x_{t-1}

Two famous examples!

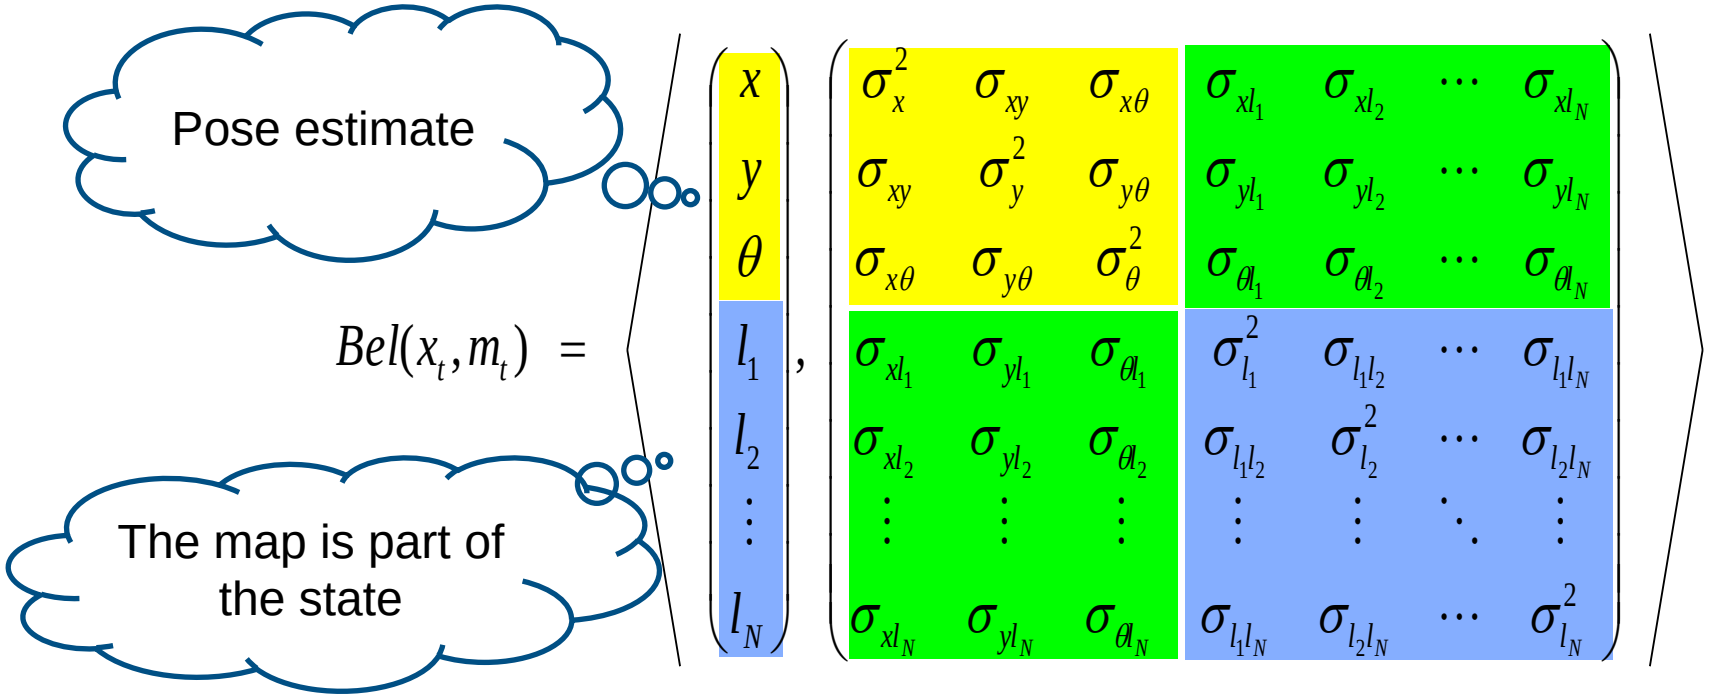
Extended Kalman Filter (EKF) SLAM

- Uses a linearized Gaussian probability distribution
- Solves the Online SLAM problem

FastSLAM

- Uses a sampled particle filter distribution model
- Solves the Full SLAM problem

Map with N landmarks:(3+2N)-dimensional Gaussian



$$x_t = A_t x_{t-1} + B_t u_t + \varepsilon_t$$

$$p(x_t \mid u_t, x_{t-1}) = N\left(x_t; A_t x_{t-1} + B_t u_t, R_t\right)$$

Map with N landmarks:(3+2N)-dimensional Gaussian

Pose and map features correlate (and mesurements correct both)

Pose estimate

The map is part of the state

$$Bel(x_t, m_t) = \begin{pmatrix} x \\ y \\ \theta \\ l_1 \\ l_2 \\ \vdots \\ l_N \end{pmatrix}, \begin{pmatrix} \sigma_x^2 & \sigma_{xy} & \sigma_{x\theta} & \sigma_{xl_1} & \sigma_{xl_2} & \cdots & \sigma_{xl_N} \\ \sigma_{xy} & \sigma_y^2 & \sigma_{y\theta} & \sigma_{yl_1} & \sigma_{yl_2} & \cdots & \sigma_{yl_N} \\ \sigma_{x\theta} & \sigma_{y\theta} & \sigma_\theta^2 & \sigma_{\theta l_1} & \sigma_{\theta l_2} & \cdots & \sigma_{\theta l_N} \\ \sigma_{xl_1} & \sigma_{yl_1} & \sigma_{\theta l_1} & \sigma_{l_1}^2 & \sigma_{l_1 l_2} & \cdots & \sigma_{l_1 l_N} \\ \sigma_{xl_2} & \sigma_{yl_2} & \sigma_{\theta l_2} & \sigma_{l_1 l_2} & \sigma_{l_2}^2 & \cdots & \sigma_{l_2 l_N} \\ \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ \sigma_{xl_N} & \sigma_{yl_N} & \sigma_{\theta l_N} & \sigma_{l_1 l_N} & \sigma_{l_2 l_N} & \cdots & \sigma_{l_N}^2 \end{pmatrix}$$

$$z_t = C_t x_t + \delta_t$$

$$p(z_t \mid x_t) = N(z_t; C_t x_t, Q_t)$$

Bayes Filter: The Algorithm

$$Bel(x_t) = \eta\ P(z_t \mid x_t) \int P(x_t \mid u_t, x_{t-1})\ Bel(x_{t-1})\ dx_{t-1}$$

Algorithm Bayes_filter(*Bel(x), d*):

If *d* is a perceptual data item *z* then

For all *x* do

$$Bel'(x) = P(z \mid x) Bel(x)$$

correction

Else if *d* is an action data item *u* then

For all *x* do

$$Bel'(x) = \int P(x \mid u, x')\ Bel(x')\ dx'$$

prediction

Return *Bel'(x)*

Kalman Filter Algorithm

Algorithm Kalman_filter(μ_{t-1}, Σ_{t-1}, u_t, z_t):

Prediction:

$$\bar{\mu}_t = A_t \mu_{t-1} + B_t u_t$$
$$\bar{\Sigma}_t = A_t \Sigma_{t-1} A_t^T + R_t$$

Correction:

$$K_t = \bar{\Sigma}_t C_t^T (C_t \bar{\Sigma}_t C_t^T + Q_t)^{-1}$$
$$\mu_t = \bar{\mu}_t + K_t (z_t - C_t \bar{\mu}_t)$$
$$\Sigma_t = (I - K_t C_t) \bar{\Sigma}_t$$

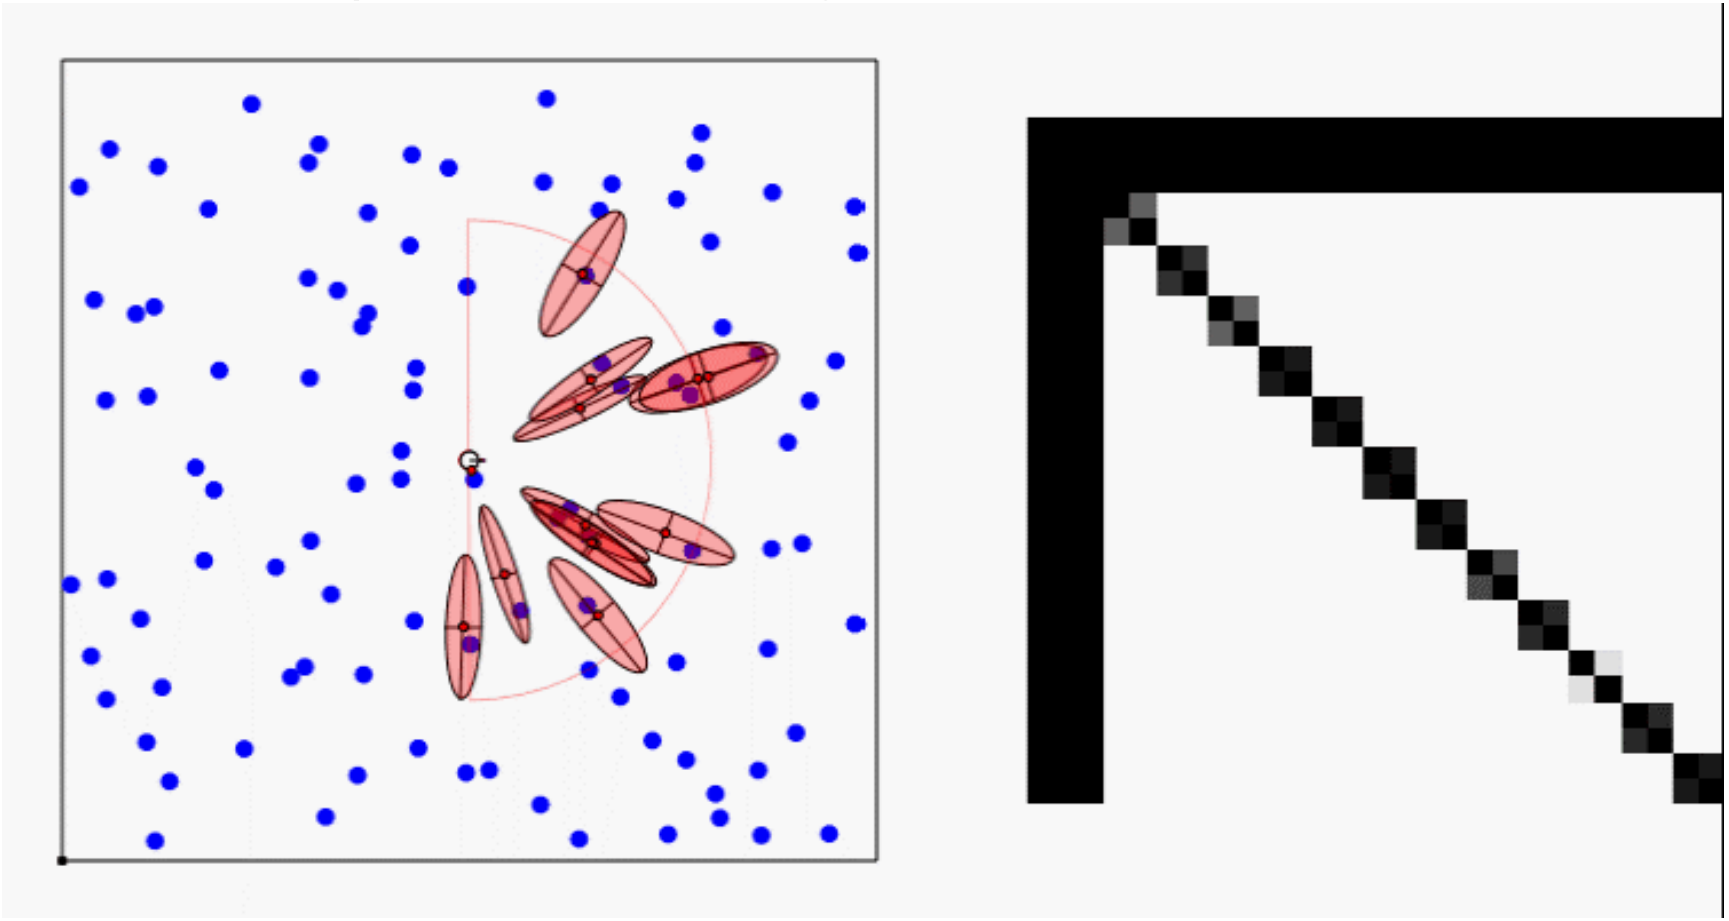
Return μ_t, Σ_t `

Not much different from standard EKF ... but the state dimention increases!!

$$Bel(x_t, m_t) = \left\langle \begin{pmatrix} x \\ y \\ \theta \\ l_1 \\ l_2 \\ \vdots \\ l_N \end{pmatrix}, \begin{pmatrix} \sigma_x^2 & \sigma_{xy} & \sigma_{x\theta} & \sigma_{xl_1} & \sigma_{xl_2} & \cdots & \sigma_{xl_N} \\ \sigma_{xy} & \sigma_y^2 & \sigma_{y\theta} & \sigma_{yl_1} & \sigma_{yl_2} & \cdots & \sigma_{yl_N} \\ \sigma_{x\theta} & \sigma_{y\theta} & \sigma_\theta^2 & \sigma_{\theta l_1} & \sigma_{\theta l_2} & \cdots & \sigma_{\theta l_N} \\ \sigma_{xl_1} & \sigma_{yl_1} & \sigma_{\theta l_1} & \sigma_{l_1}^2 & \sigma_{l_1 l_2} & \cdots & \sigma_{l_1 l_N} \\ \sigma_{xl_2} & \sigma_{yl_2} & \sigma_{\theta l_2} & \sigma_{l_1 l_2} & \sigma_{l_2}^2 & \cdots & \sigma_{l_2 l_N} \\ \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ \sigma_{xl_N} & \sigma_{yl_N} & \sigma_{\theta l_N} & \sigma_{l_1 l_N} & \sigma_{l_2 l_N} & \cdots & \sigma_{l_N}^2 \end{pmatrix} \right\rangle$$

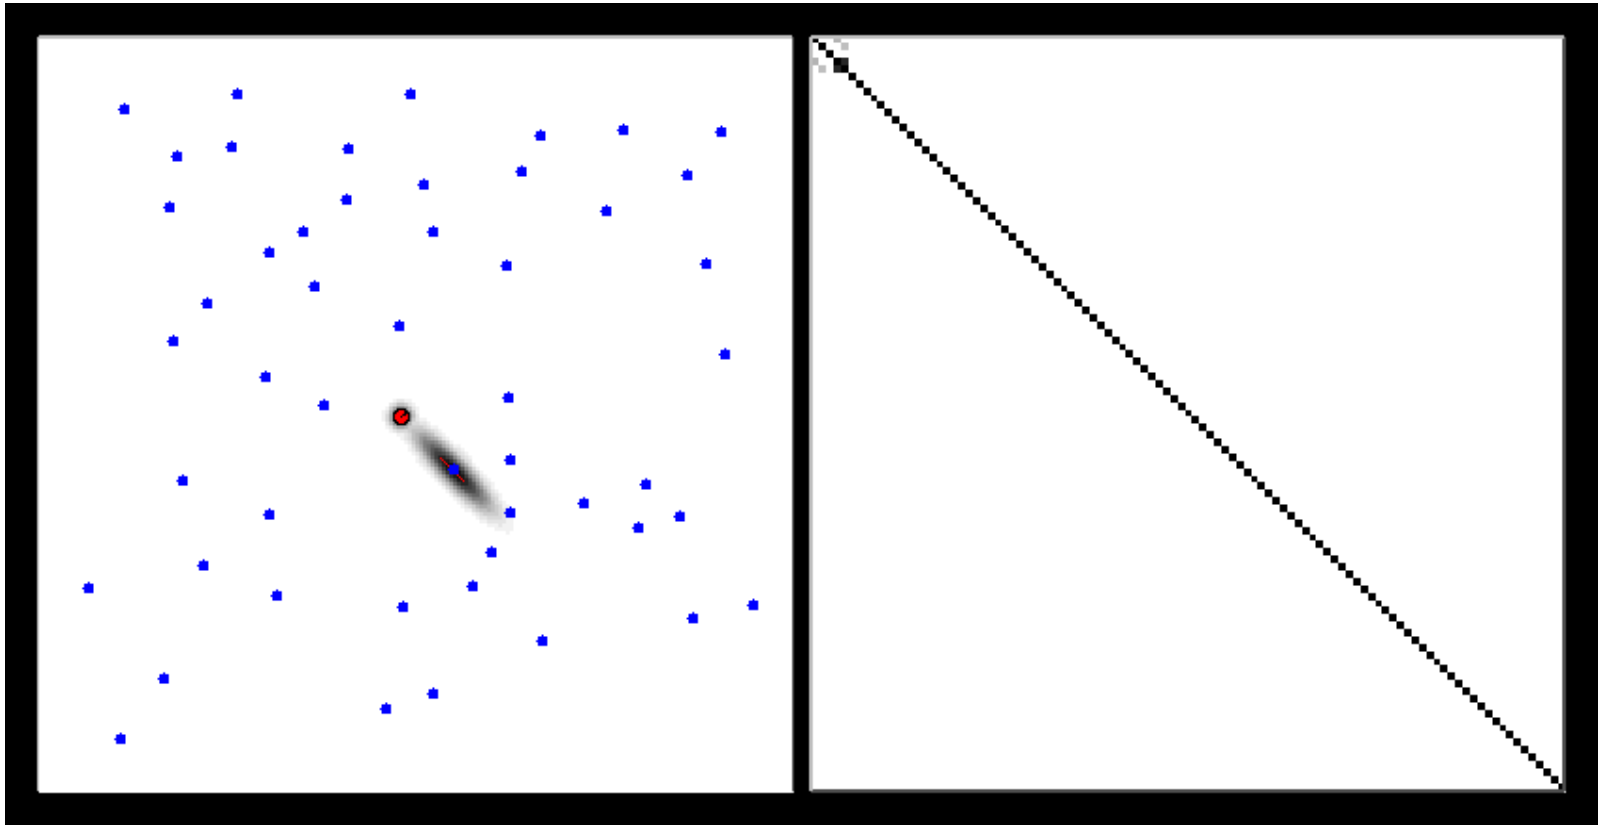
Classical Solution – The EKF

Approximate the SLAM posterior with a high-dimensional Gaussian



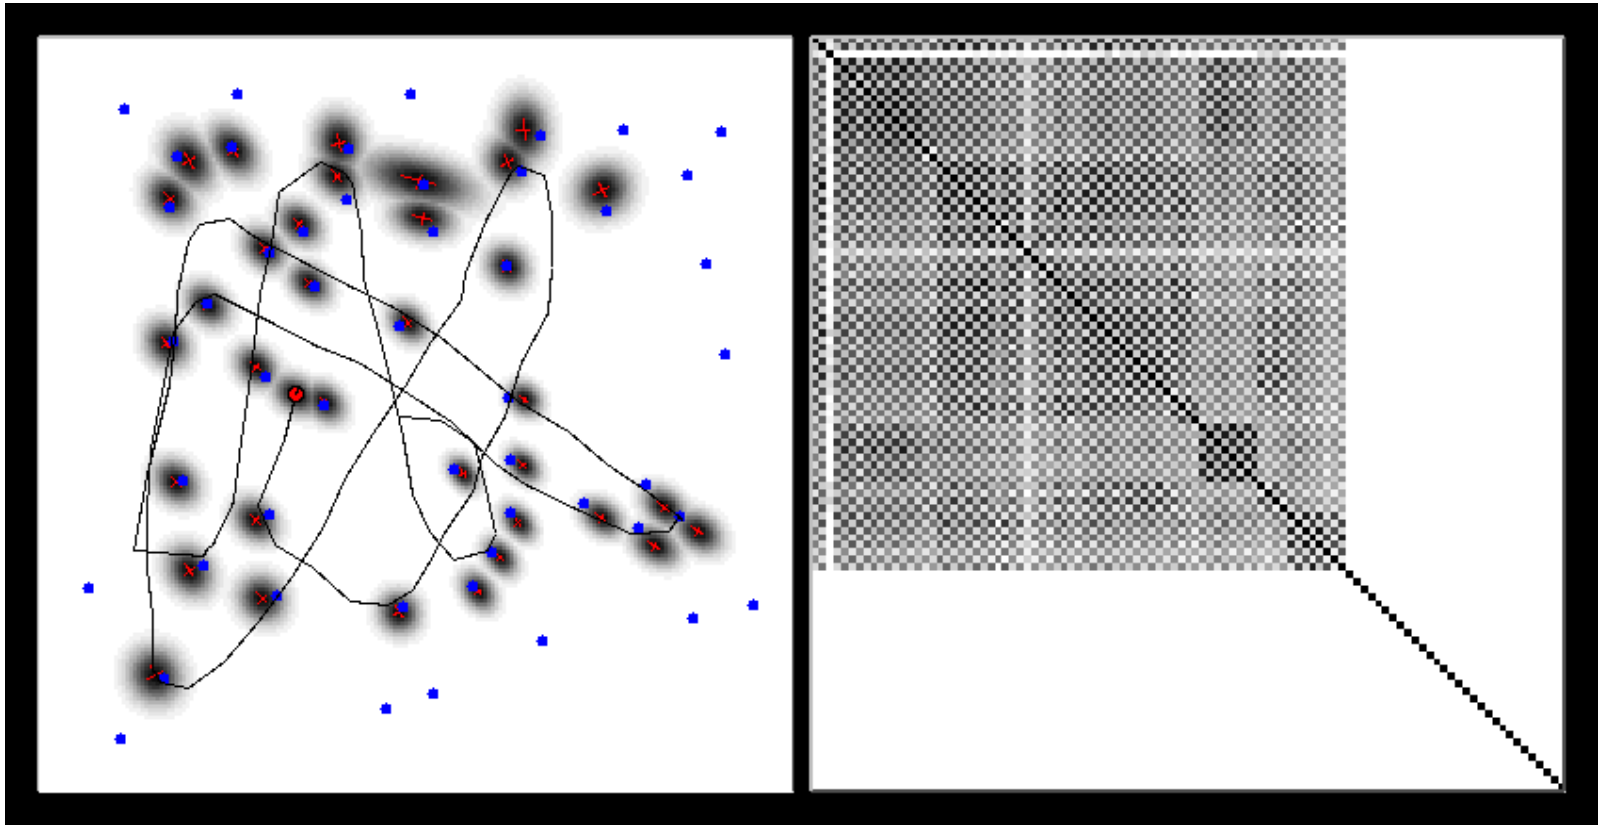
Blue path = true path **Red path** = estimated path **Black path** = odometry

EKF-SLAM



Map Correlation matrix

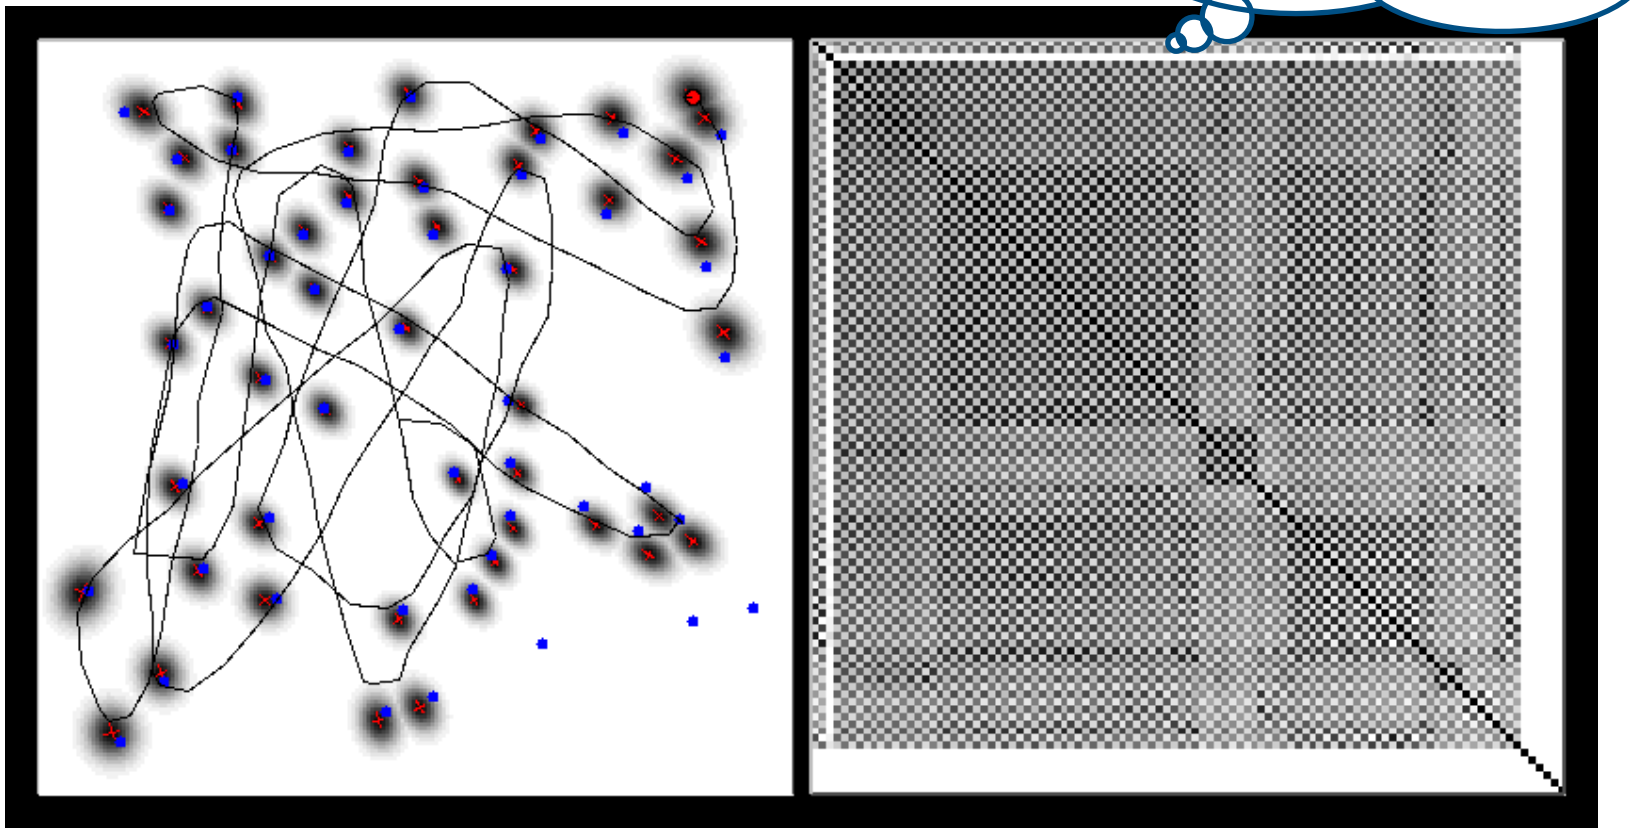
EKF-SLAM



Map Correlation matrix

EKF-SLAM

Landmark positions uncorrelated with the robot orientation ...



Map Correlation matrix

Properties of KF-SLAM (Linear Case)

Theorem: The determinant of any sub-matrix of the map covariance matrix decreases monotonically as successive observations are made.

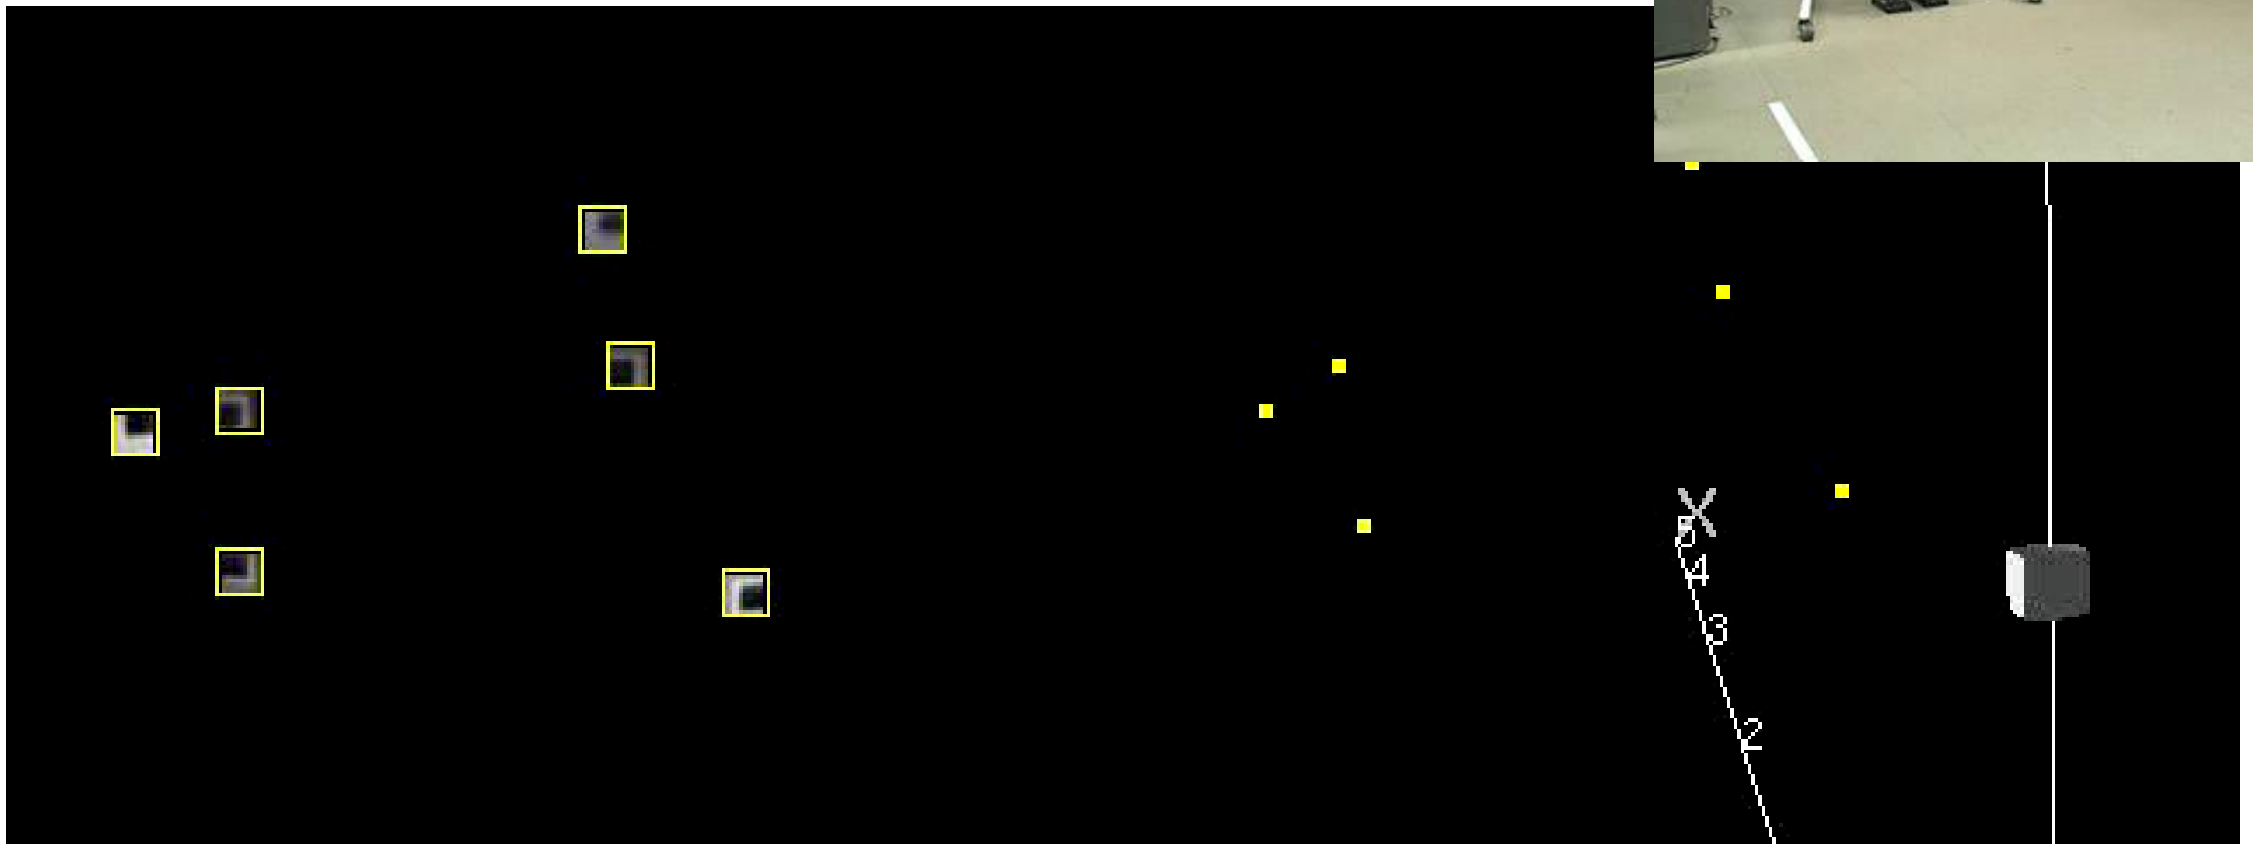
Theorem: In the limit the landmark estimates become fully correlated

[Dissanayake et al., 2001]

Are we happy about this?

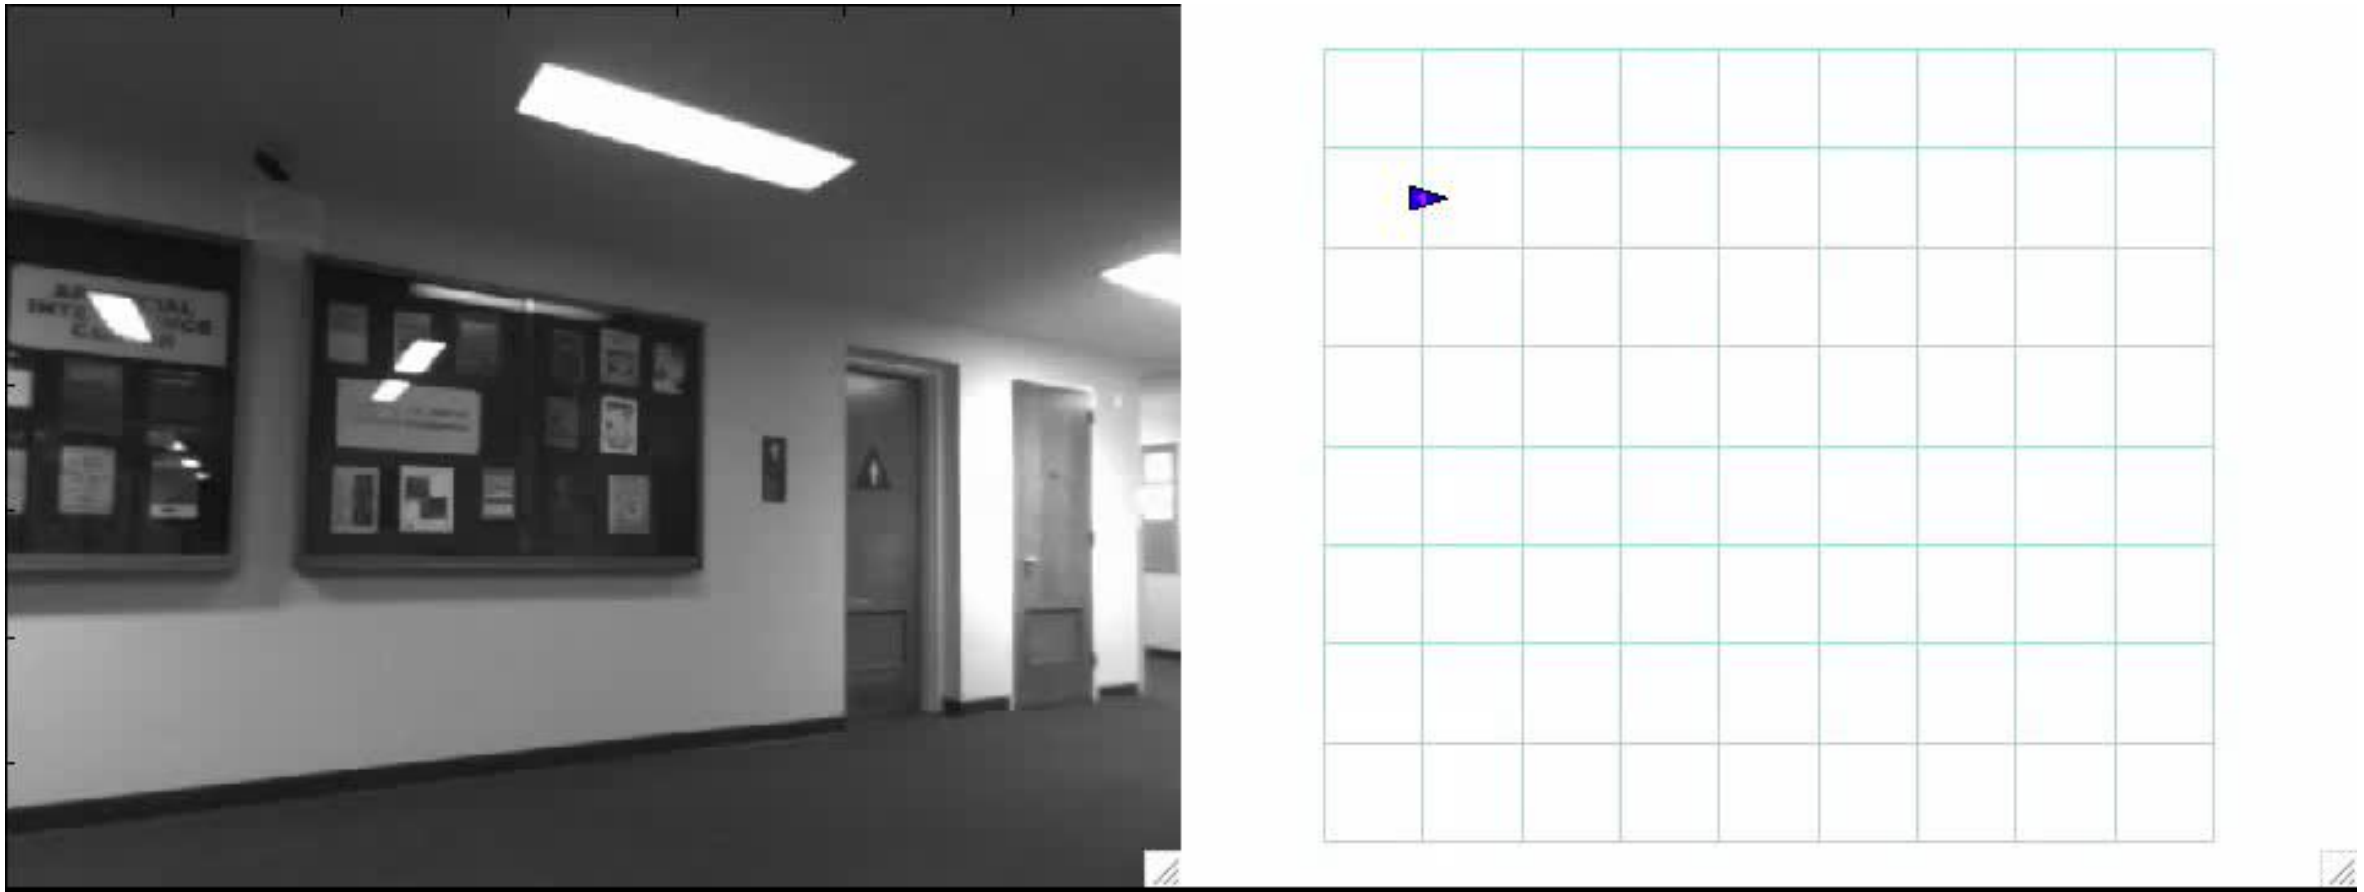
- Quadratic in the number of landmarks: $O(n^2)$
- Convergence results for the linear case
- Can diverge if nonlinearities are large!
- Have been applied successfully in large-scale environments.
- Approximations reduce the computational complexity.

Monocular SLAM Origins …



Monocular SLAM Origins …

Larger size environments …



Federated Information Sharing SLAM - Vision Only

BLUE: predicted points - CYAN: updated points - MAGENTA: predicted rays - RED: updated rays

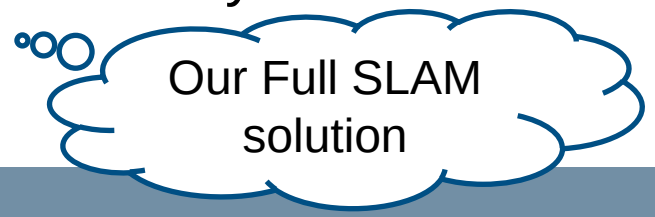
Beyond EKF-SLAM

EKF-SLAM works pretty well but ...

- EKF-SLAM employs linearized models of nonlinear motion and observation models and so inherits many caveats.
- Computational effort is demand because computation grows quadratically with the number of landmarks.

Possible solutions

- Local submaps [Leonard & al 99, Bosse & al 02, Newman & al 03]
- Sparse links (correlations) [Lu & Milios 97, Guivant & Nebot 01]
- Sparse extended information filters [Frese et al. 01, Thrun et al. 02]
- Rao-Blackwellisation (FastSLAM) [Murphy 99, Montemerlo et al. 02, ...]
  - Represents nonlinear process and non-Gaussian uncertainty
  - Rao-Blackwellized method reduces computation



The FastSLAM Idea (Full SLAM)

In the general case we have

$$p(x_t, m|z_t) \neq p(x_t|z_t)p(m|z_t)$$

However if we consider the full trajectory X_t rather than the single pose x_t

$$p(X_t, m|z_t) = p(X_t|z_t)p(m|X_t, z_t)$$

In FastSLAM, the trajectory X_t is represented by particles $X_t(i)$ while the map is represented by a factorization called Rao-Blackwellized Filter

- $p(X_t|z_t)$ through particles
- $p(m|X_t, z_t)$ using an EKF

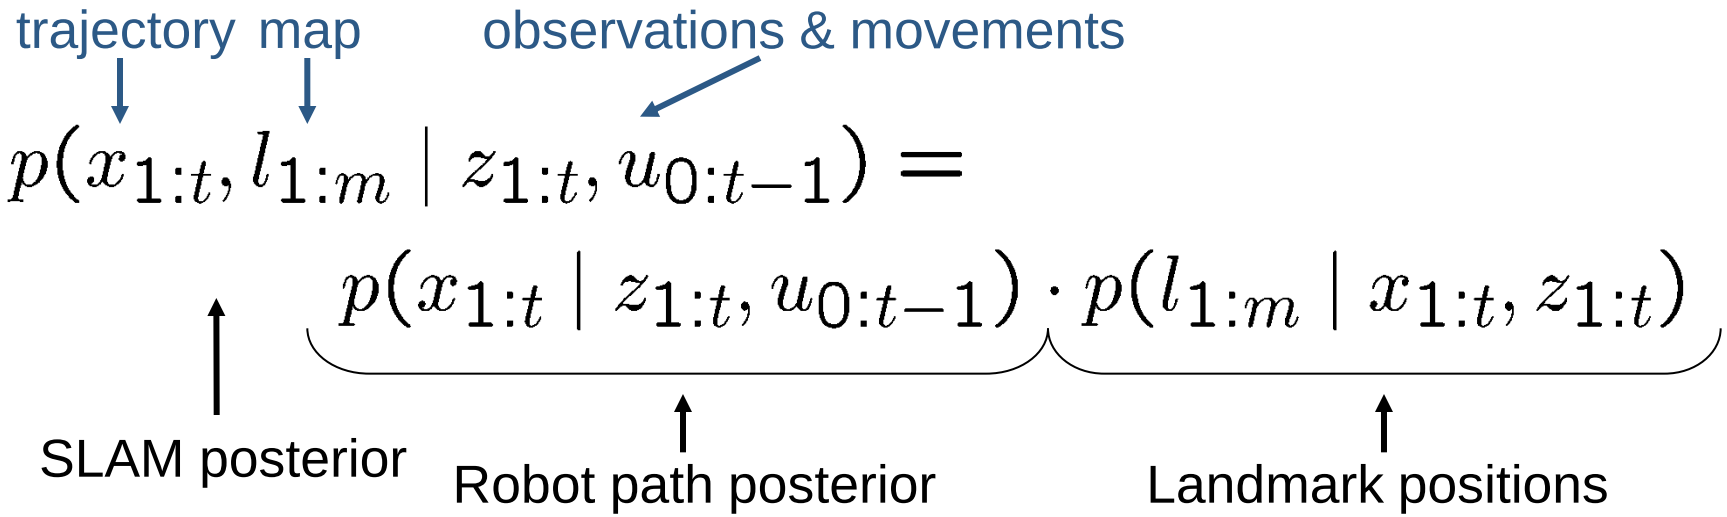
$$p(m|X_t^{(i)}, z_t) = \prod_j^M p(m_j|X_t^{(i)}, z_t)$$

map poses

FastSLAM Formulation

Decouple map of features from poses ...

- Each particle represents a robot trajectory
- Feature measurements are correlated thought the robot trajectory
- If the robot trajectory is known all of the features would be uncorrelated
- Treat each pose particle as if it is the true trajectory, processing all of the feature measurements independently



Factored Posterior: Rao-Blackwellization

$$
\begin{aligned}
& p(x_{1:t}, l_{1:m} \mid z_{1:t}, u_{0:t-1}) \\
&= \; p(x_{1:t} \mid z_{1:t}, u_{0:t-1}) \cdot p(l_{1:m} \mid x_{1:t}, z_{1:t}) \\
&= \; p(x_{1:t} \mid z_{1:t}, u_{0:t-1}) \cdot \prod_{i=1}^{M} p(l_i \mid x_{1:t}, z_{1:t})
\end{aligned}
$$

Robot path posterior (localization problem)

Conditionally independent landmark positions

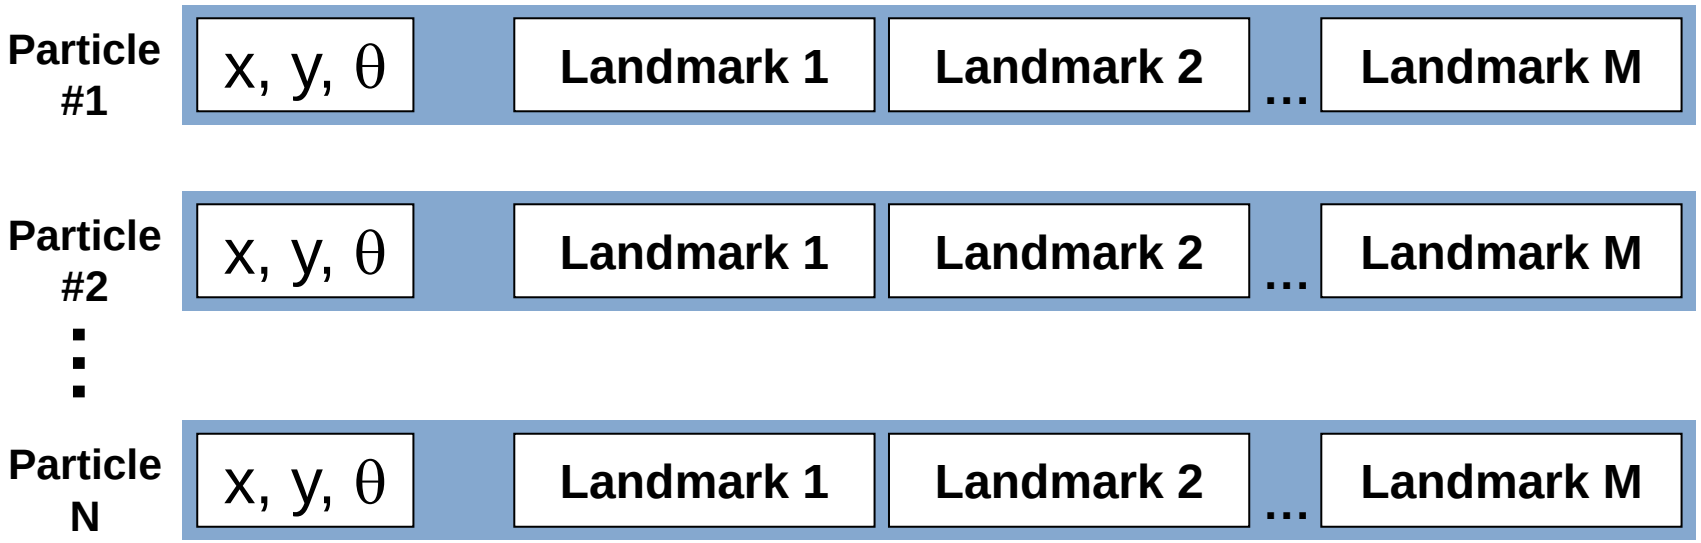
Dimension of state space is reduced by factorization making particle filtering possible

$$
\begin{aligned}
& p(x_{1:t}, l_{1:m} \mid z_{1:t}, u_{0:t-1}) = \\
& \qquad p(x_{1:t} \mid z_{1:t}, u_{0:t-1}) \cdot \prod_{i=1}^{M} p(l_i \mid x_{1:t}, z_{1:t})
\end{aligned}
$$

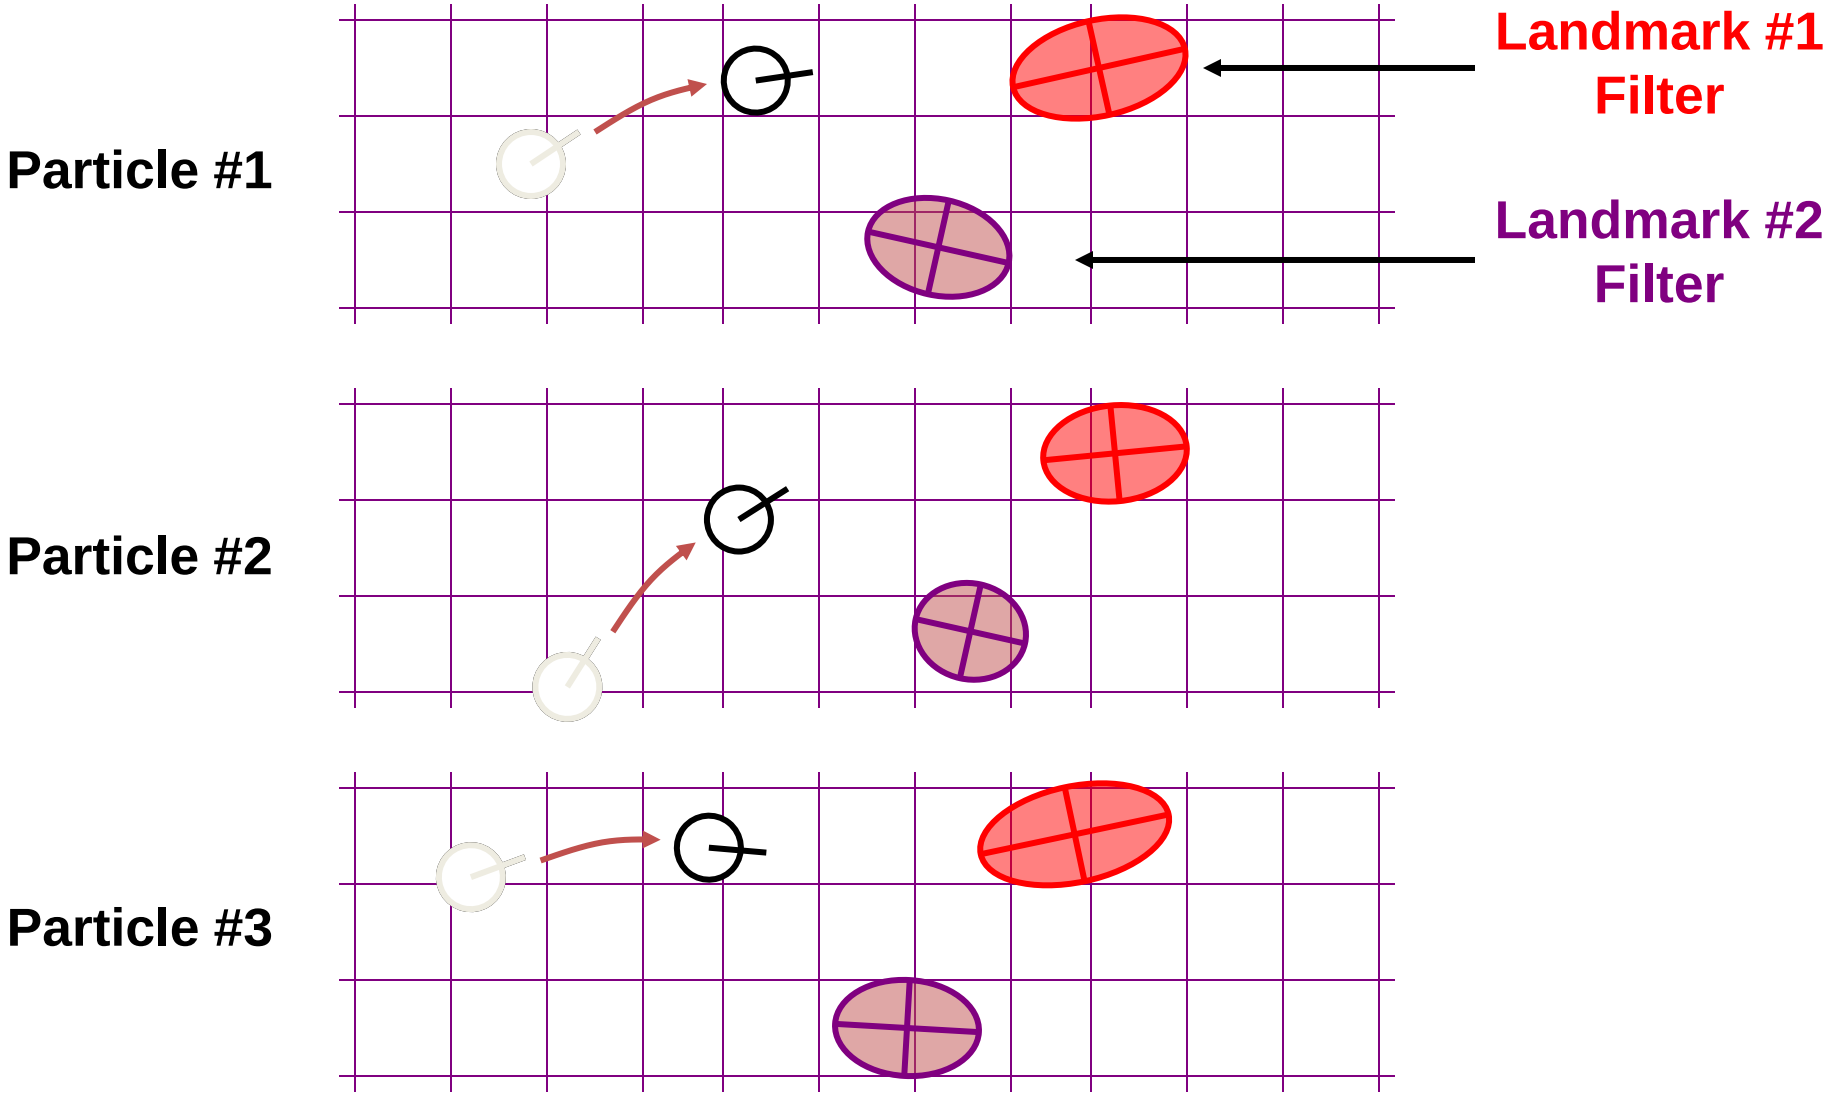
FastSLAM in Practice

Rao-Blackwellized particle filtering based on landmarks [Montemerlo et al., 2002]

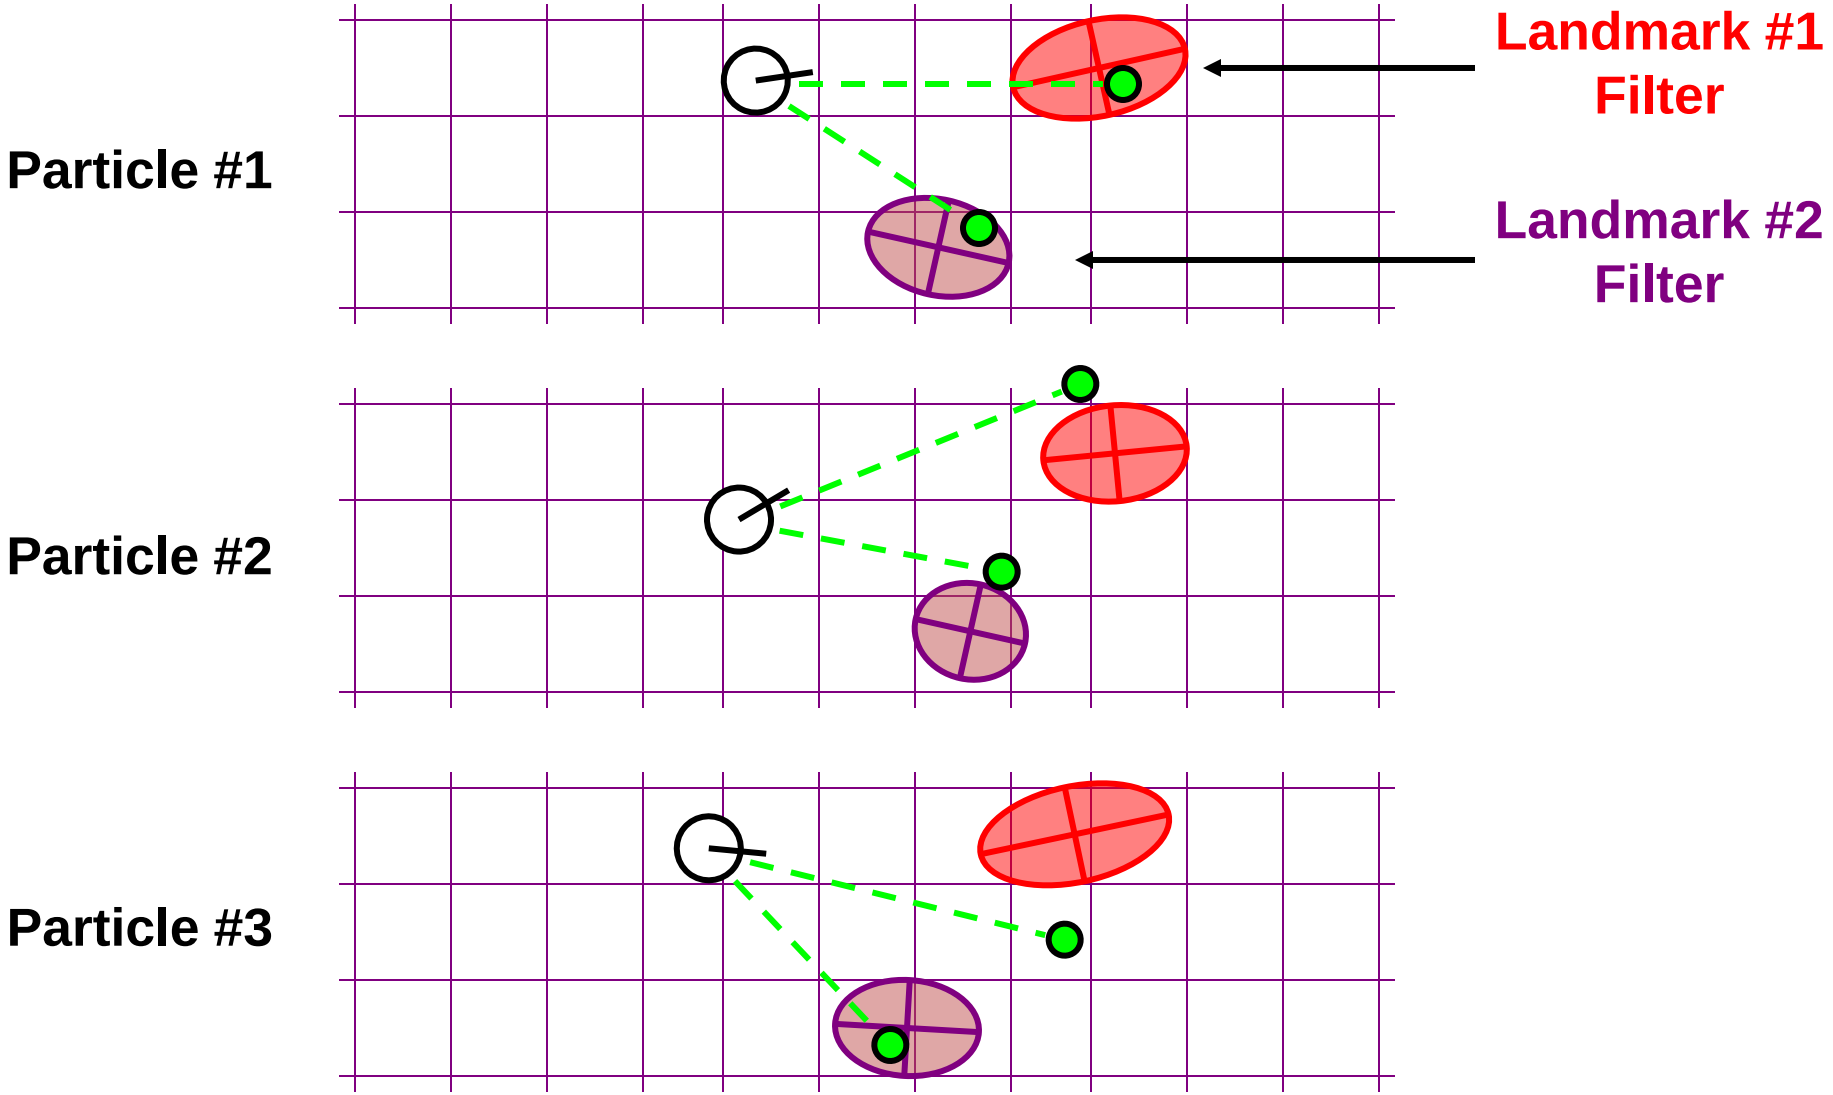
- Each particle is a trajectory (last pose + reference to previous)
- Each landmark is represented by a 2x2 Extended Kalman Filter (EKF)
- Each particle therefore has to maintain M EKFs



FastSLAM – Action Update

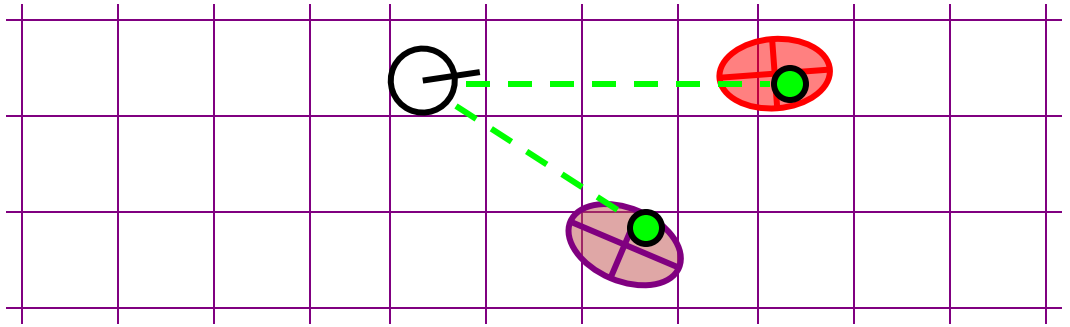


FastSLAM – Sensor Update



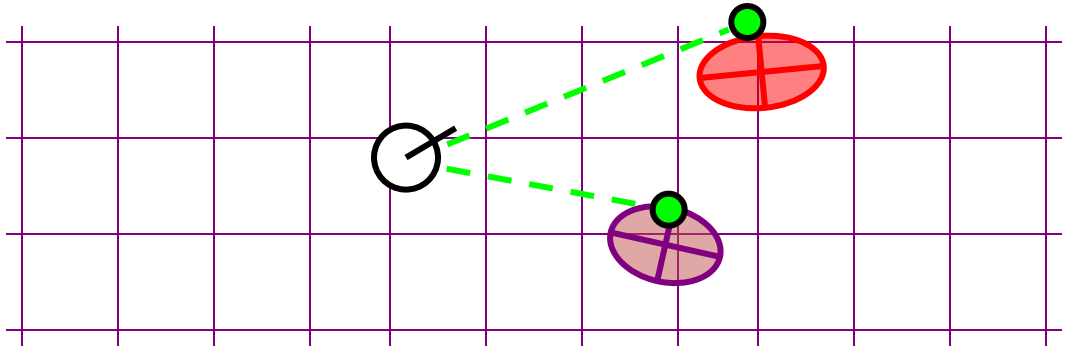
FastSLAM – Sensor Update

Particle #1



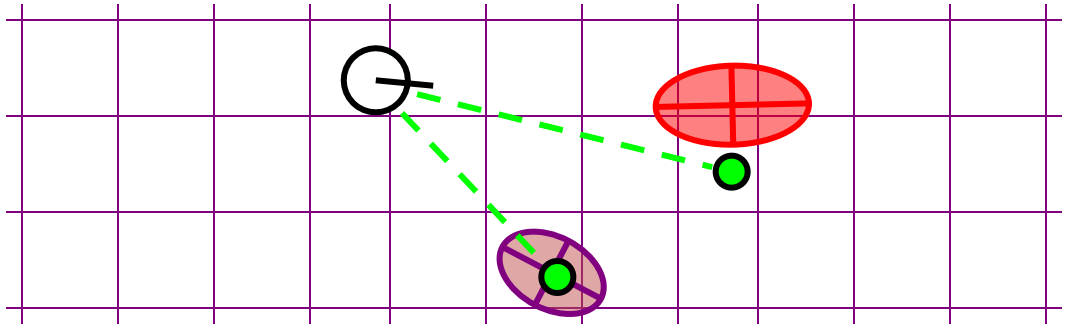
Weight = 0.8

Particle #2



Weight = 0.4

Particle #3



Weight = 0.1

FastSLAM Complexity

Update robot particles based on control u_{t-1} $O(N)$ **Constant time per particle**

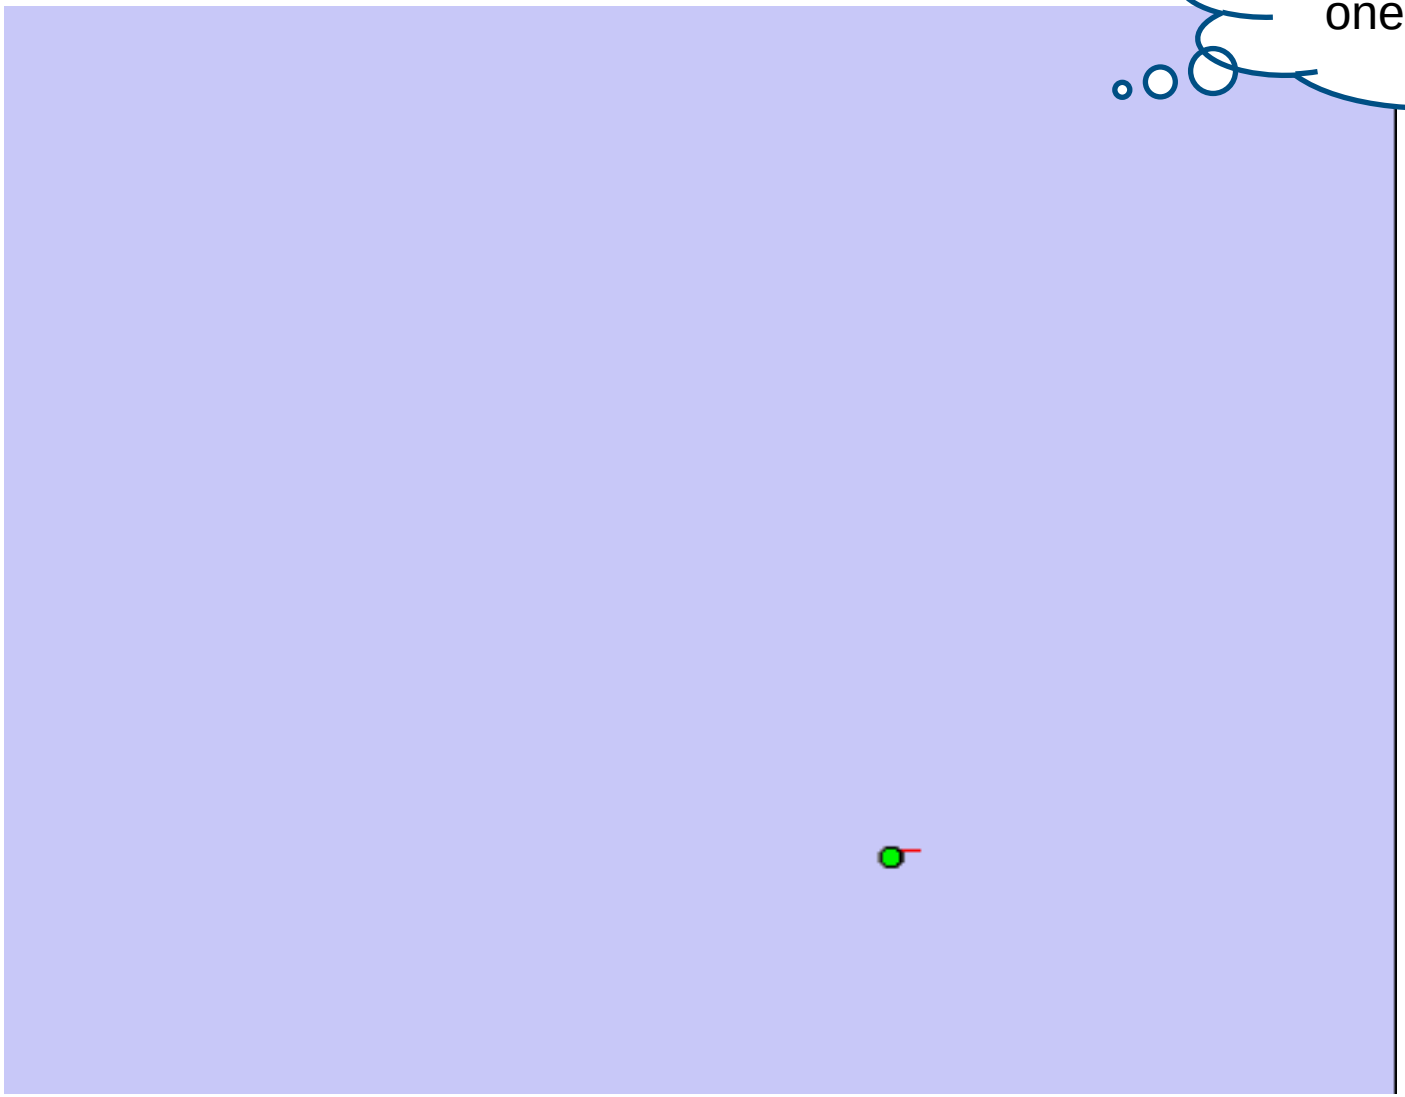
Incorporate observation z_t into Kalman filters $O(N \cdot \log(M))$ **Log time per particle**

Resample particle set $O(N \cdot \log(M))$ **Log time per particle**

$O(N \cdot \log(M))$
Log time per particle

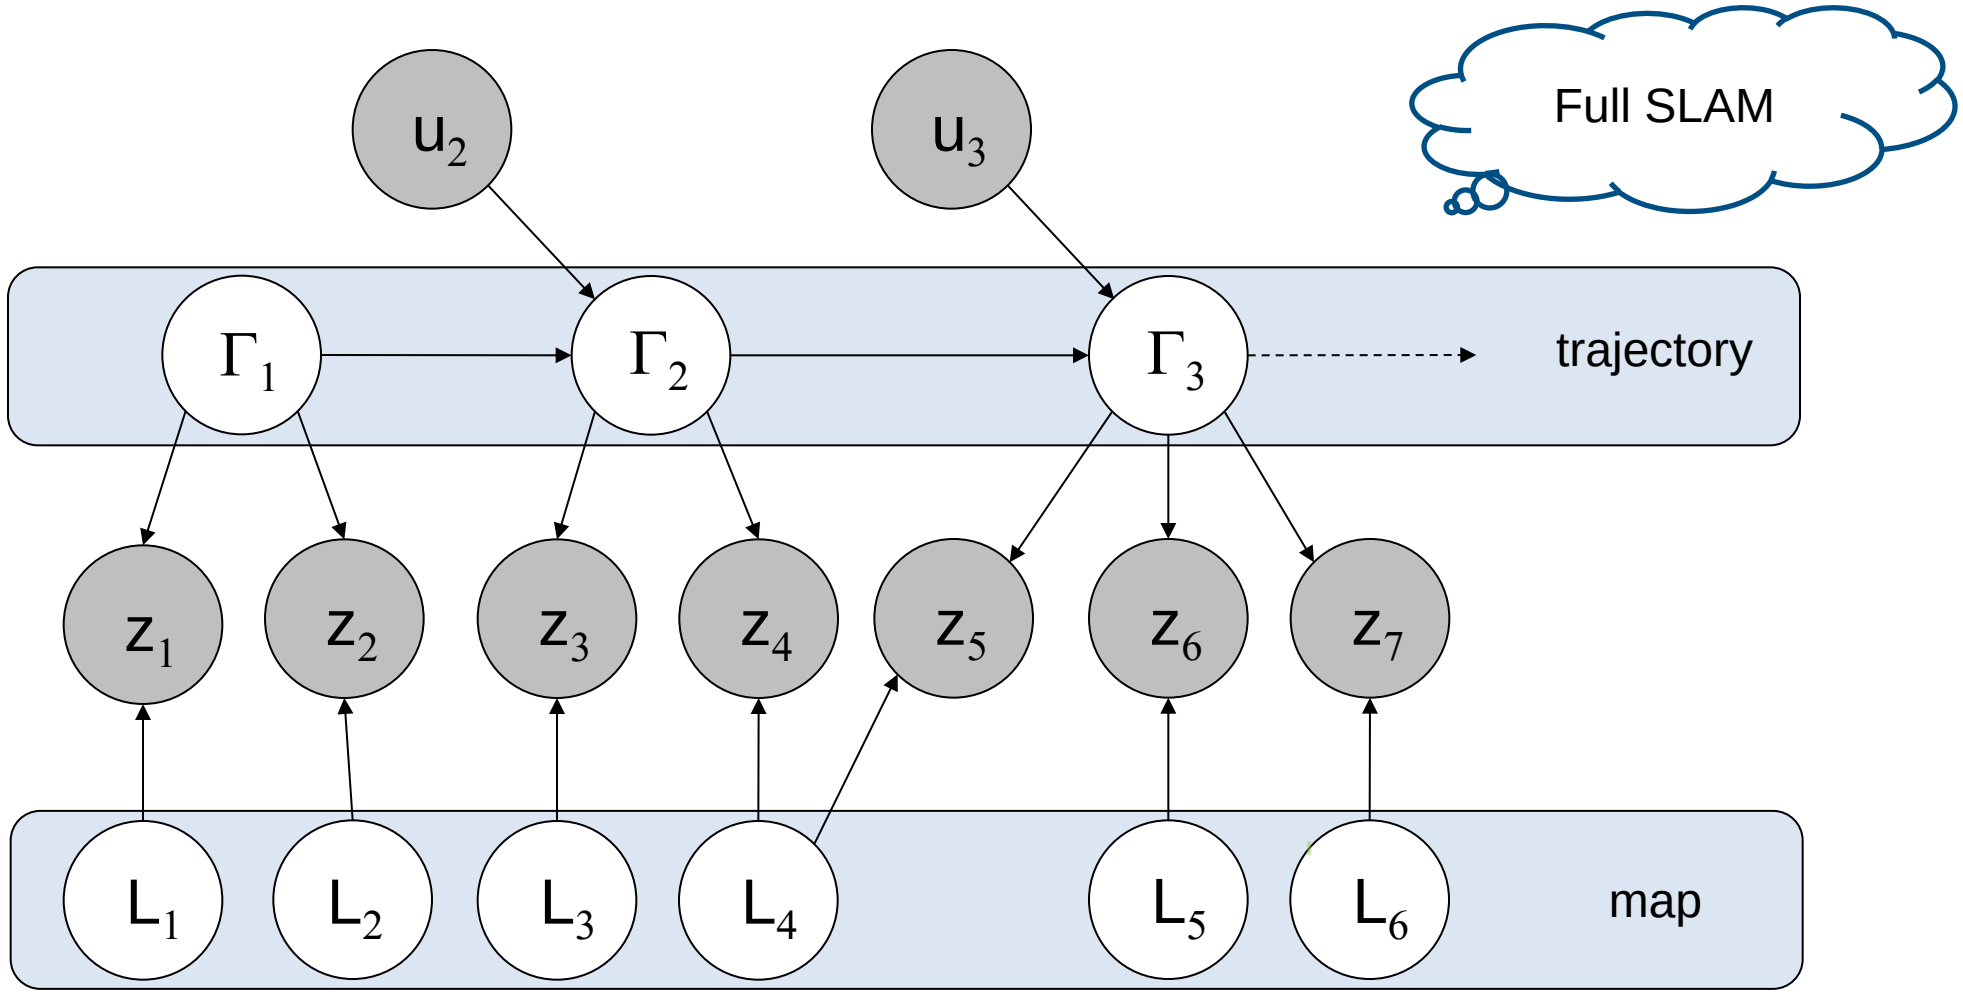
N = Number of particles
M = Number of map features

Fast-SLAM Example



Impressive result, but no one does this any more!

Dynamic Bayesian Networks and Full SLAM



Smoothing: $p(\Gamma_{1:t}, L_1, \ldots, L_N | Z_{1:t}, U_{1:t})$

Bayesian Networks and Maximum A Posteriori

In Full SLAM we model

$X = \Gamma_{0:t}, L_{1:n}$

$$p(X|Z,U) = p(\Gamma_{0:t}, L_1, \dots, L_n | z_{1:t}, u_{1:t})$$

then we look for Maximum A Posteriori

$$X^{MAP} = argmax\, p(X|Z,U)$$

given

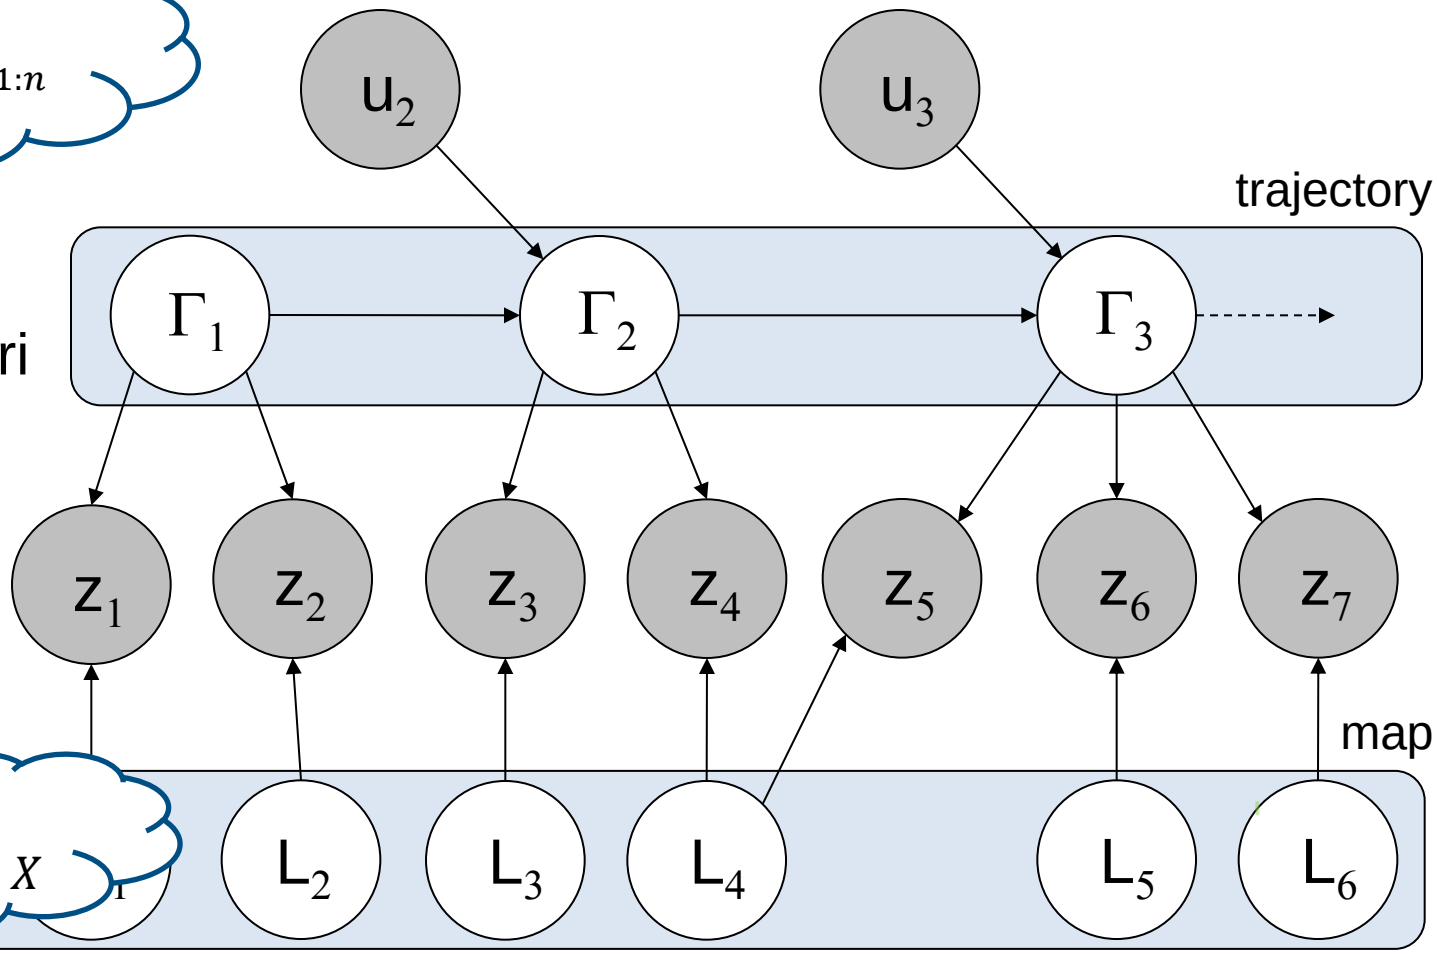
$$p(X|Z,U) = P(X,Z,U)/P(Z,U)$$

we can solve for

$$X^{MAP} = argmax\, p(X,Z,U)$$

Doesn't depend on X

Full Joint Distribution



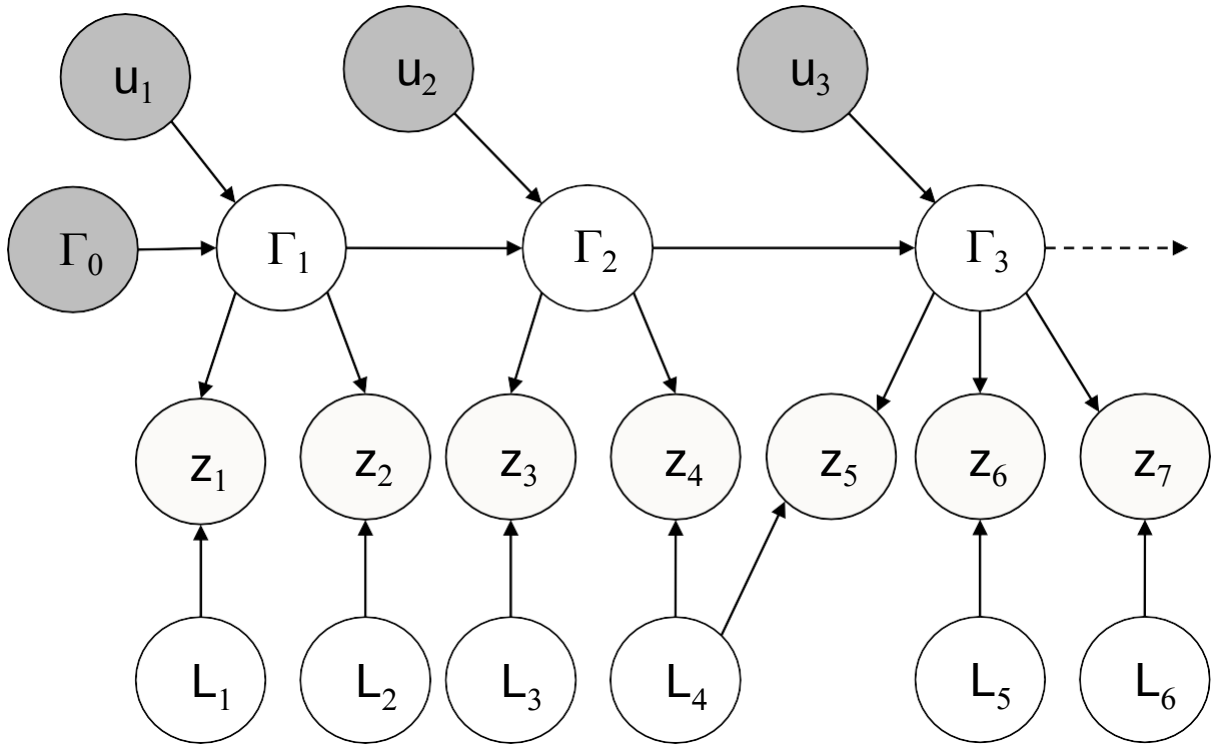
Smoothing: $p(\Gamma_{1:t}, L_1, \dots, L_N | Z_{1:t}, U_{1:t})$

Bayesian Networks and Joint Distribution

The full joint distribution of a Bayesian network is the product of the conditionals

$$p(X, Z, U) = p(\Gamma_{0:3}, L_{1:6}, z_{1:7}, u_{1:3}) =$$

$$= p(\Gamma_0)p(\Gamma_1|\Gamma_0, u_1)p(\Gamma_2|\Gamma_1, u_2)p(\Gamma_3|\Gamma_2, u_3)$$
$$p(z_1|\Gamma_1, L_1)p(L_1)p(z_2|\Gamma_1, L_2)p(L_2)$$
$$p(z_3|\Gamma_2, L_3)p(L_3)p(z_4|\Gamma_2, L_4)p(L_4)$$
$$p(z_5|\Gamma_3, L_4)p(z_6|\Gamma_3, L_5)p(L_5)$$
$$p(z_7|\Gamma_3, L_6)p(L_6)$$

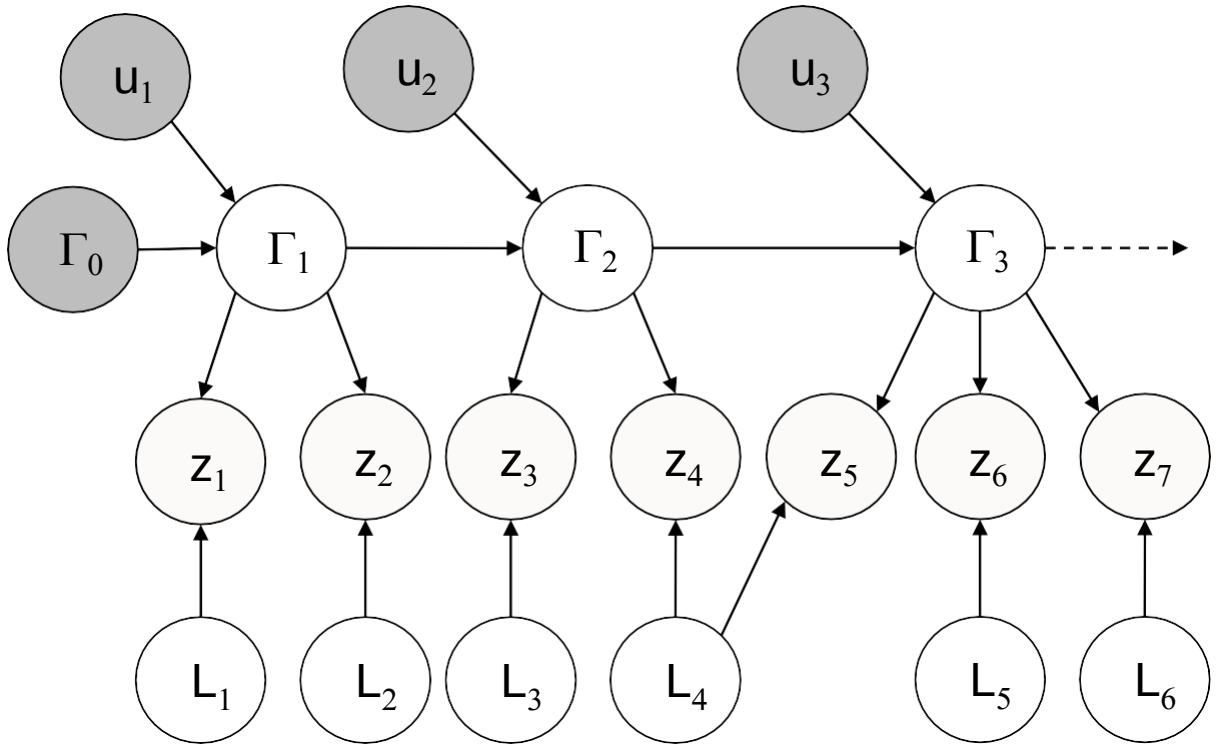


Bayesian Networks and Joint Distribution

The full joint distribution of a Bayesian network is the product of the conditionals

$$p(X, Z, U) = p(\Gamma_{0:3}, L_{1:6}, z_{1:7}, u_{1:3}) =$$

$$= p(\Gamma_0)p(\Gamma_1|\Gamma_0, u_1)p(\Gamma_2|\Gamma_1, u_2)p(\Gamma_3|\Gamma_2, u_3)$$
$$p(z_1|\Gamma_1, L_1)p(L_1)p(z_2|\Gamma_1, L_2)p(L_2)$$
$$p(z_3|\Gamma_2, L_3)p(L_3)p(z_4|\Gamma_2, L_4)p(L_4)$$
$$p(z_5|\Gamma_3, L_4)p(z_6|\Gamma_3, L_5)p(L_5)$$
$$p(z_7|\Gamma_3, L_6)p(L_6)$$



$$= \phi(\Gamma_1, \Gamma_0, u_1)\phi(\Gamma_2, \Gamma_1, u_2)\phi(\Gamma_3, \Gamma_2, u_3)\phi(z_1, \Gamma_1, L_1)\phi(z_2, \Gamma_1, L_2)$$
$$\phi(z_3, \Gamma_2, L_3)\phi(z_4, \Gamma_2, L_4)\phi(z_5, \Gamma_3, L_4)\phi(z_6, \Gamma_3, L_5)\phi(z_7, \Gamma_3, L_6)$$

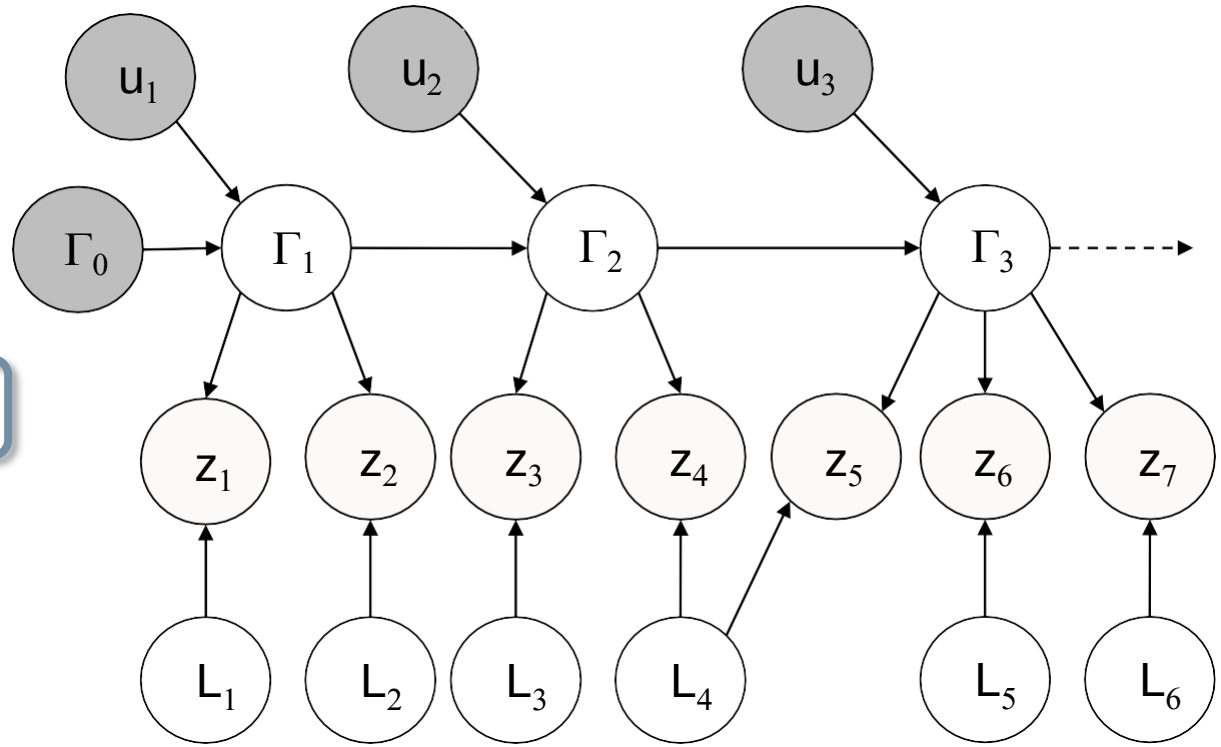
Bayesian Networks and Joint Distribution

The full joint distribution of a Bayesian network is the product of the conditionals

$$p(X, Z, U) = p(\Gamma_{0:3}, L_{1:6}, z_{1:7}, u_{1:3}) =$$

$$= p(\Gamma_0)p(\Gamma_1|\Gamma_0, u_1)p(\Gamma_2|\Gamma_1, u_2)p(\Gamma_3|\Gamma_2, u_3)$$
$$p(z_1|\Gamma_1, L_1)p(L_1)p(z_2|\Gamma_1, L_2)p(L_2)$$
$$p(z_3|\Gamma_2, L_3)p(L_3)p(z_4|\Gamma_2, L_4)p(L_4)$$
$$p(z_5|\Gamma_3, L_4)p(z_6|\Gamma_3, L_5)p(L_5)$$
$$p(z_7|\Gamma_3, L_6)p(L_6)$$

$$= \phi(\Gamma_1, \Gamma_0, u_1)\phi(\Gamma_2, \Gamma_1, u_2)\phi(\Gamma_3, \Gamma_2, u_3)\phi(z_1, \Gamma_1, L_1)\phi(z_2, \Gamma_1, L_2)$$
$$\phi(z_3, \Gamma_2, L_3)\phi(z_4, \Gamma_2, L_4)\phi(z_5, \Gamma_3, L_4)\phi(z_6, \Gamma_3, L_5)\phi(z_7, \Gamma_3, L_6)$$



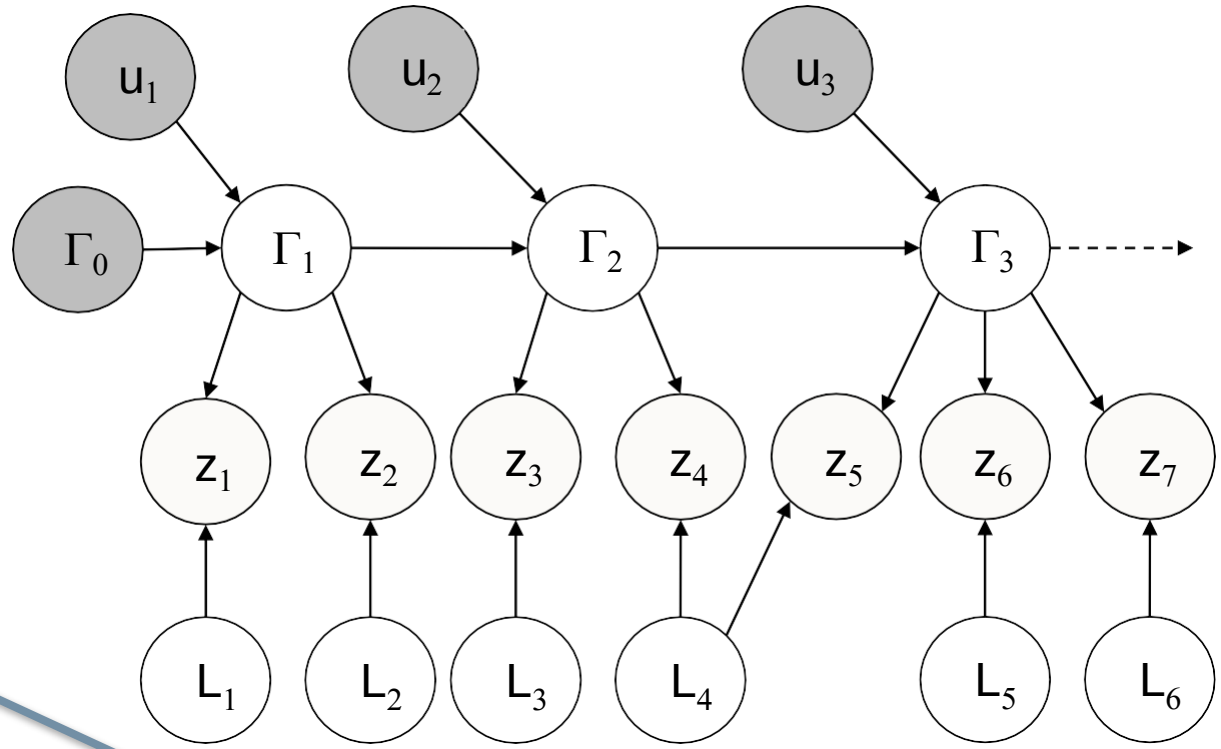
Bayesian Networks and Joint Distribution

The full joint distribution of a Bayesian network is the product of the conditionals

$$p(X, Z, U) = p(\Gamma_{0:3}, L_{1:6}, z_{1:7}, u_{1:3}) =$$

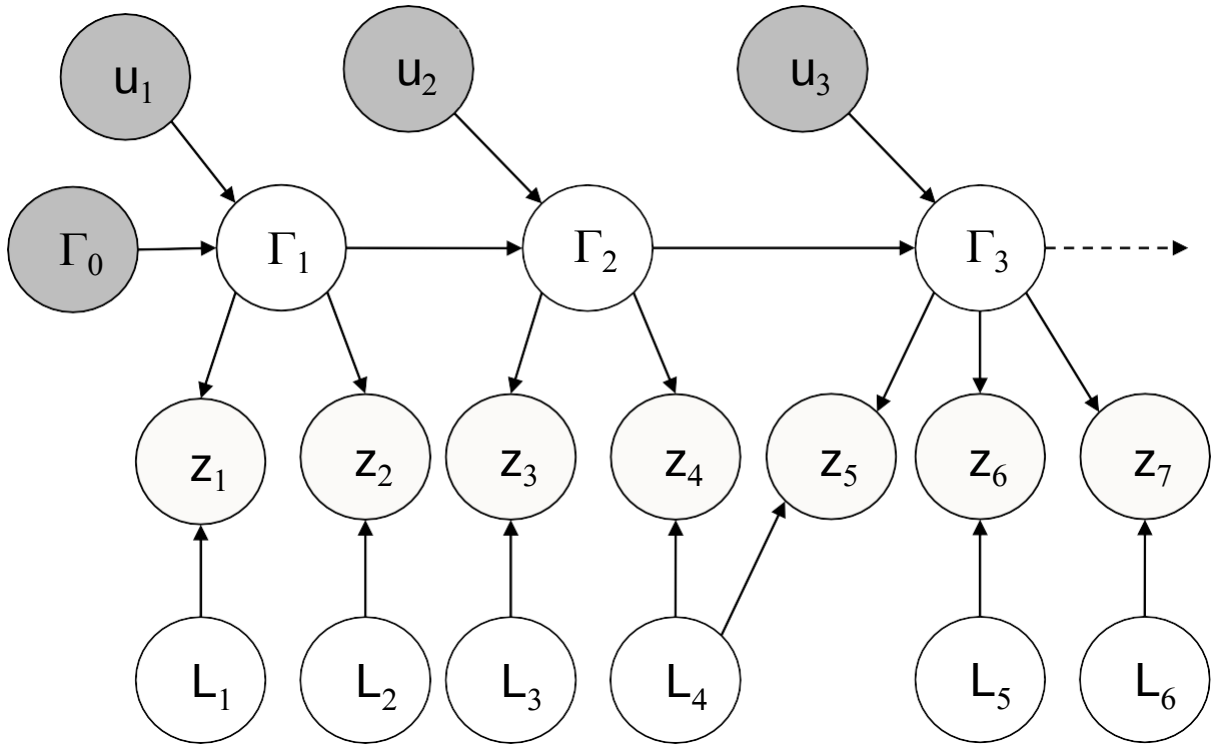
$$= p(\Gamma_0)p(\Gamma_1|\Gamma_0, u_1)p(\Gamma_2|\Gamma_1, u_2)p(\Gamma_3|\Gamma_2, u_3)$$
$$p(z_1|\Gamma_1, L_1)p(L_1)p(z_2|\Gamma_1, L_2)p(L_2)$$
$$p(z_3|\Gamma_2, L_3)p(L_3)p(z_4|\Gamma_2, L_4)p(L_4)$$
$$p(z_5|\Gamma_3, L_4)p(z_6|\Gamma_3, L_5)p(L_5)$$
$$p(z_7|\Gamma_3, L_6)p(L_6)$$

$$= \phi(\Gamma_1, \Gamma_0, u_1)\phi(\Gamma_2, \Gamma_1, u_2)\phi(\Gamma_3, \Gamma_2, u_3)\phi(z_1, \Gamma_1, L_1)\phi(z_2, \Gamma_1, L_2)$$
$$\phi(z_3, \Gamma_2, L_3)\phi(z_4, \Gamma_2, L_4)\phi(z_5, \Gamma_3, L_4)\phi(z_6, \Gamma_3, L_5)\phi(z_7, \Gamma_3, L_6)$$



Bayesian Networks and Joint Distribution

The full joint distribution of a Bayesian network is the product of the conditionals



$$p(X, Z, U) = p(\Gamma_{0:3}, L_{1:6}, z_{1:7}, u_{1:3}) =$$

$$= p(\Gamma_0)p(\Gamma_1|\Gamma_0, u_1)p(\Gamma_2|\Gamma_1, u_2)p(\Gamma_3|\Gamma_2, u_3)$$

$$= \phi(\Gamma_1, \Gamma_0, u_1)\phi(\Gamma_2, \Gamma_1, u_2)\phi(\Gamma_3, \Gamma_2, u_3)\phi(z_1, \Gamma_1, L_1)\phi(z_2, \Gamma_1, L_2)$$
$$\phi(z_3, \Gamma_2, L_3)\phi(z_4, \Gamma_2, L_4)\phi(z_5, \Gamma_3, L_4)\phi(z_6, \Gamma_3, L_5)\phi(z_7, \Gamma_3, L_6)$$

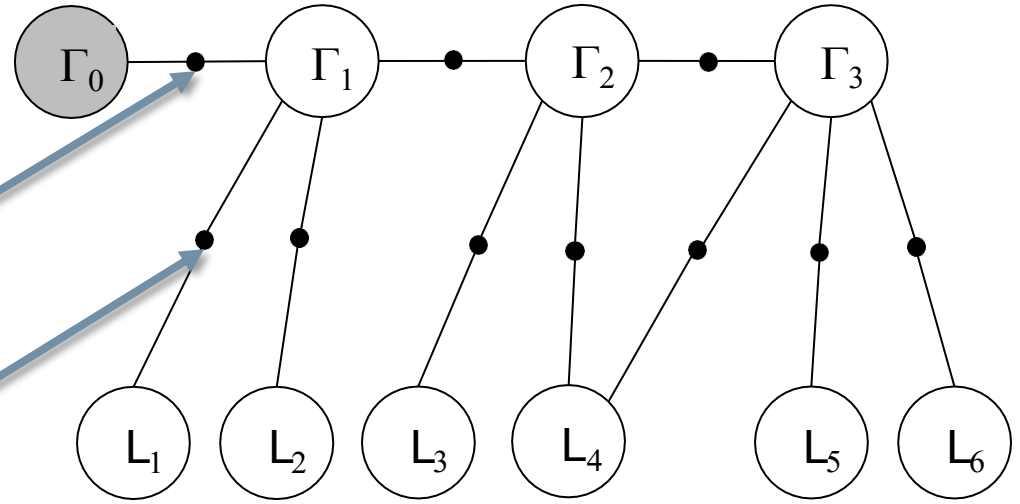
Full SLAM and (Factor) Graph Optimization



Given the Factor Graph Full Joint Distribution

$$p(X, Z, U) = \prod_i \phi_i(X_i)$$

The Full SLAM problem is reformulated as

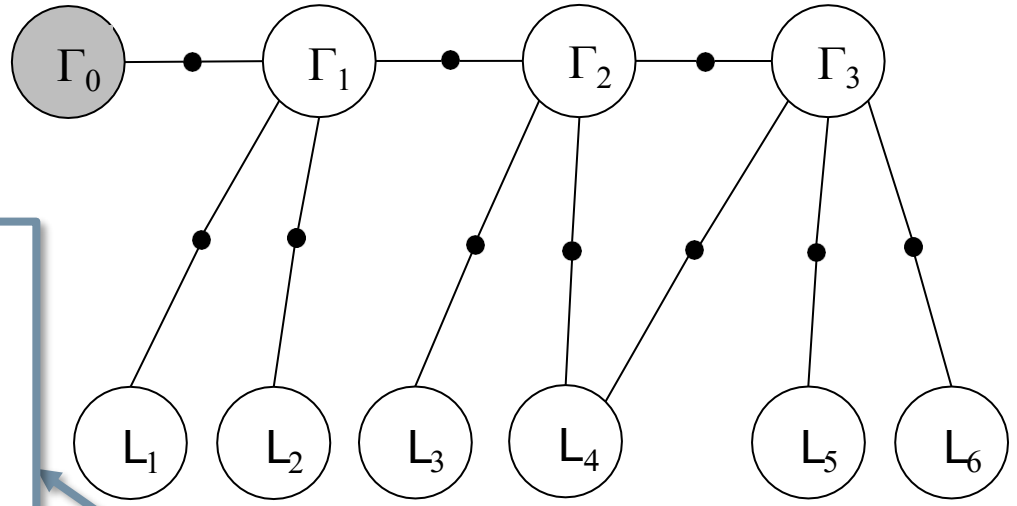
$$X^{MAP} = argmax\, p(X|Z, U) = argmax\, p(X, Z, U) = argmax \prod_i \phi_i(X_i)$$

Let's also assume to have Gaussian Factors (not mandatory but convenient)

$$\phi(\Gamma_1, \Gamma_0, u_1) = p(\Gamma_1|\Gamma_0, u_1) = N(g(\Gamma_0, u_1), R) = \frac{1}{\sqrt{|2\pi R|}} \cdot \exp\left(-\frac{1}{2}\|g(\Gamma_0, u_1) - \Gamma_1\|_R^2\right)$$

$$\phi(z_1, \Gamma_1, L_1) = p(z_1|\Gamma_1, L_1) = N(h(\Gamma_1, L_1), Q) = \frac{1}{\sqrt{|2\pi Q|}} \cdot \exp\left(-\frac{1}{2}\|h(\Gamma_1, L_1) - z_1\|_Q^2\right)$$

Full SLAM and (Factor) Graph Optimization



Given the Factor Graph Full Joint Distribution

$$\phi(\Gamma_1, \Gamma_0, u_1) \sim N(g(\Gamma_0, u_1), R)$$

$$\phi(\Gamma_1, \Gamma_0, u_1) \sim \frac{1}{\sqrt{|2\pi R|}} \cdot \exp\left(-\frac{1}{2}\|g(\Gamma_0, u_1) - \Gamma_1\|_R^2\right) =$$

$$= \frac{1}{\sqrt{|2\pi R|}} \cdot \exp\left(-\frac{1}{2}(g(\Gamma_0, u_1) - \Gamma_1)^T R^{-1}(g(\Gamma_0, u_1) - \Gamma_1)\right)$$

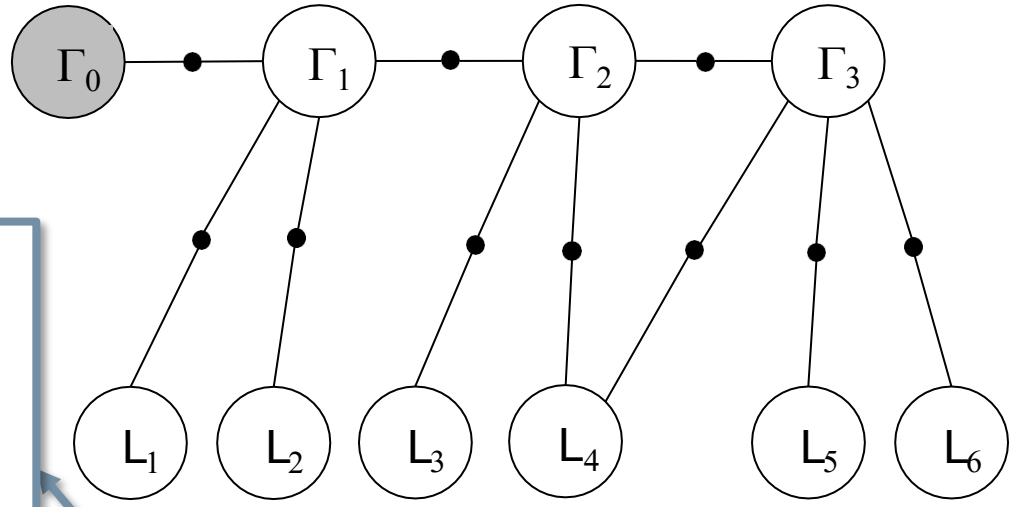
$$Z, U) = argmax \prod_i \phi_i(X_i)$$

Let's also assume to have Gaussian Factors (not mandatory but convenient)

$$\phi(\Gamma_1, \Gamma_0, u_1) = p(\Gamma_1|\Gamma_0, u_1) = N(g(\Gamma_0, u_1), R) = \frac{1}{\sqrt{|2\pi R|}} \cdot \exp\left(-\frac{1}{2}\|g(\Gamma_0, u_1) - \Gamma_1\|_R^2\right)$$

$$\phi(z_1, \Gamma_1, L_1) = p(z_1|\Gamma_1, L_1) = N(h(\Gamma_1, L_1), Q) = \frac{1}{\sqrt{|2\pi Q|}} \cdot \exp\left(-\frac{1}{2}\|h(\Gamma_1, L_1) - z_1\|_Q^2\right)$$

Full SLAM and (Factor) Graph Optimization



Given the Factor Graph Full Joint Distribution

$$\phi(z_1, \Gamma_1, L) \sim N(h(\Gamma_1, L_1), Q)$$

$$\phi(z_1, \Gamma_1, L_1) \sim \frac{1}{\sqrt{|2\pi Q|}} \cdot \exp\left(-\frac{1}{2}\|h(\Gamma_1, L_1) - z_1\|_Q^2\right) =$$

$$= \frac{1}{\sqrt{|2\pi Q|}} \cdot \exp\left(-\frac{1}{2}(h(\Gamma_1, L_1) - z_1)^T Q^{-1}(h(\Gamma_1, L_1) - z_1)\right)$$

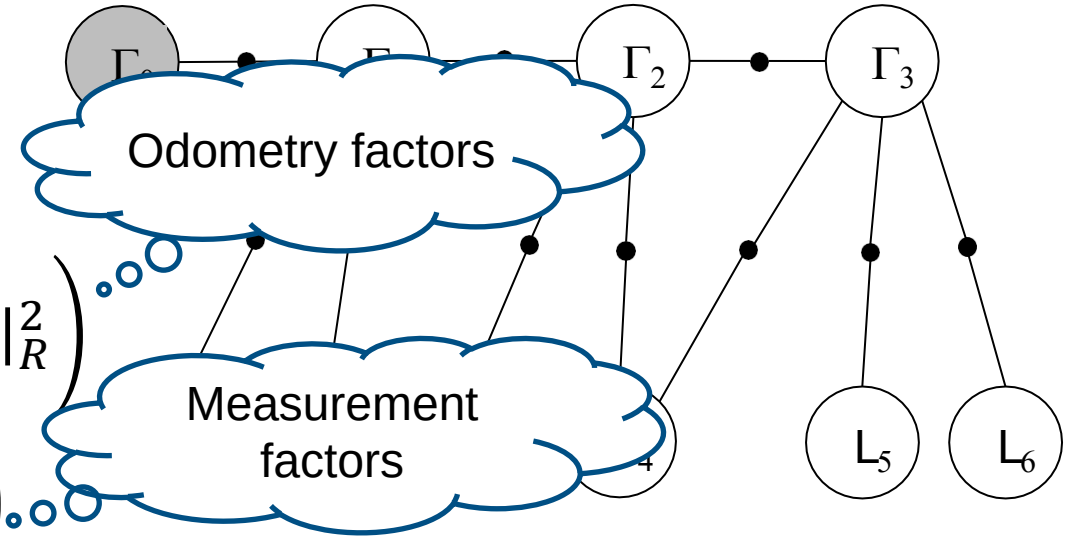
$$Z, U) = argmax \prod_i \phi_i(X_i)$$

Let's also assume to have Gaussian Factors (not mandatory but convenient)

$$\phi(\Gamma_1, \Gamma_0, u_1) = p(\Gamma_1|\Gamma_0, u_1) = N(g(\Gamma_0, u_1), R) = \frac{1}{\sqrt{|2\pi R|}} \cdot \exp\left(-\frac{1}{2}\|g(\Gamma_0, u_1) - \Gamma_1\|_R^2\right)$$

$$\phi(z_1, \Gamma_1, L_1) = p(z_1|\Gamma_1, L_1) = N(h(\Gamma_1, L_1), Q) = \frac{1}{\sqrt{|2\pi Q|}} \cdot \exp\left(-\frac{1}{2}\|h(\Gamma_1, L_1) - z_1\|_Q^2\right)$$

Full SLAM and (Factor) Graph Optimization



The (Gaussian) Full SLAM problem becomes

$$\phi_{i=u_i}(\Gamma_i, \Gamma_{i-1}, u_i) \propto \exp\left(-\frac{1}{2}\|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2\right)$$

$$\phi_{i=z_i}(z_i, \Gamma_i, L_i) = \propto \exp\left(-\frac{1}{2}\|h(\Gamma_i, L_i) - z_i\|_Q^2\right)$$

$$X^{MAP} = argmax \prod_{u_i} \exp\left(-\frac{1}{2}\|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2\right) \prod_{z_i} \exp\left(-\frac{1}{2}\|h(\Gamma_i, L_i) - z_i\|_Q^2\right)$$

If we solve for the logarithm, we get a simpler optimization algorithm

$$X^{MAP} = argmax \prod_i \phi_i(X_i) = argmax \log \prod_i \phi_i(X_i) = argmax \sum_i \log \phi_i(X_i) =$$

$$= argmax \sum_{i=u_i} \log \exp\left(-\frac{1}{2}\|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2\right) + \sum_{i=z_i} \log \exp\left(-\frac{1}{2}\|h(\Gamma_i, L_i) - z_i\|_Q^2\right)$$

Full SLAM and (Factor) Graph Optimization

The (Gaussian) Full SLAM problem becomes

$$X^{MAP} = argmax \prod_i \phi_i(X_i) = argmax \log \prod_i \phi_i(X_i) = argmax \sum_i \log \phi_i(X_i) =$$

$$= argmax \sum_{i=u_i} \log \exp\left(-\frac{1}{2}\|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2\right) + \sum_{i=z_i} \log \exp\left(-\frac{1}{2}\|h(\Gamma_i, L_i) - z_i\|_Q^2\right)$$

$$= argmax \sum_{i=u_i} -\frac{1}{2}\|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum_{i=z_i} -\frac{1}{2}\|h(\Gamma_i, L_i) - z_i\|_Q^2$$

$$= argmin \sum_{i=u_i} \|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2$$

Multiply times -2 and make max into min

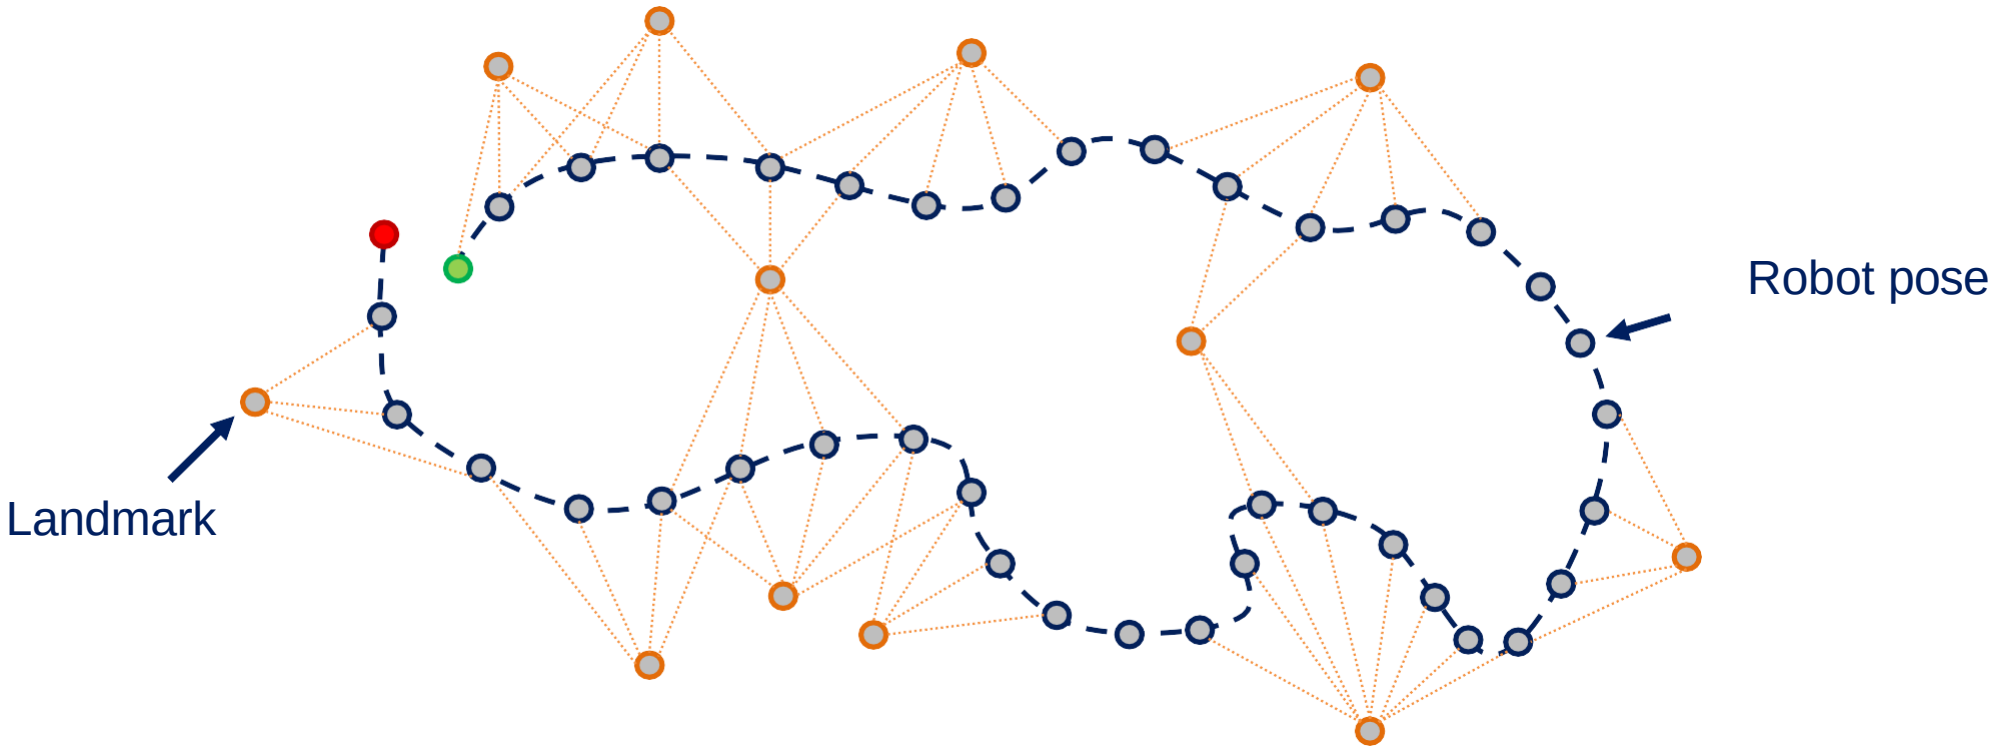
Non linear least squares on a graph

Graph SLAM

The (Gaussian) Full SLAM problem becomes

Non linear least squares on a graph

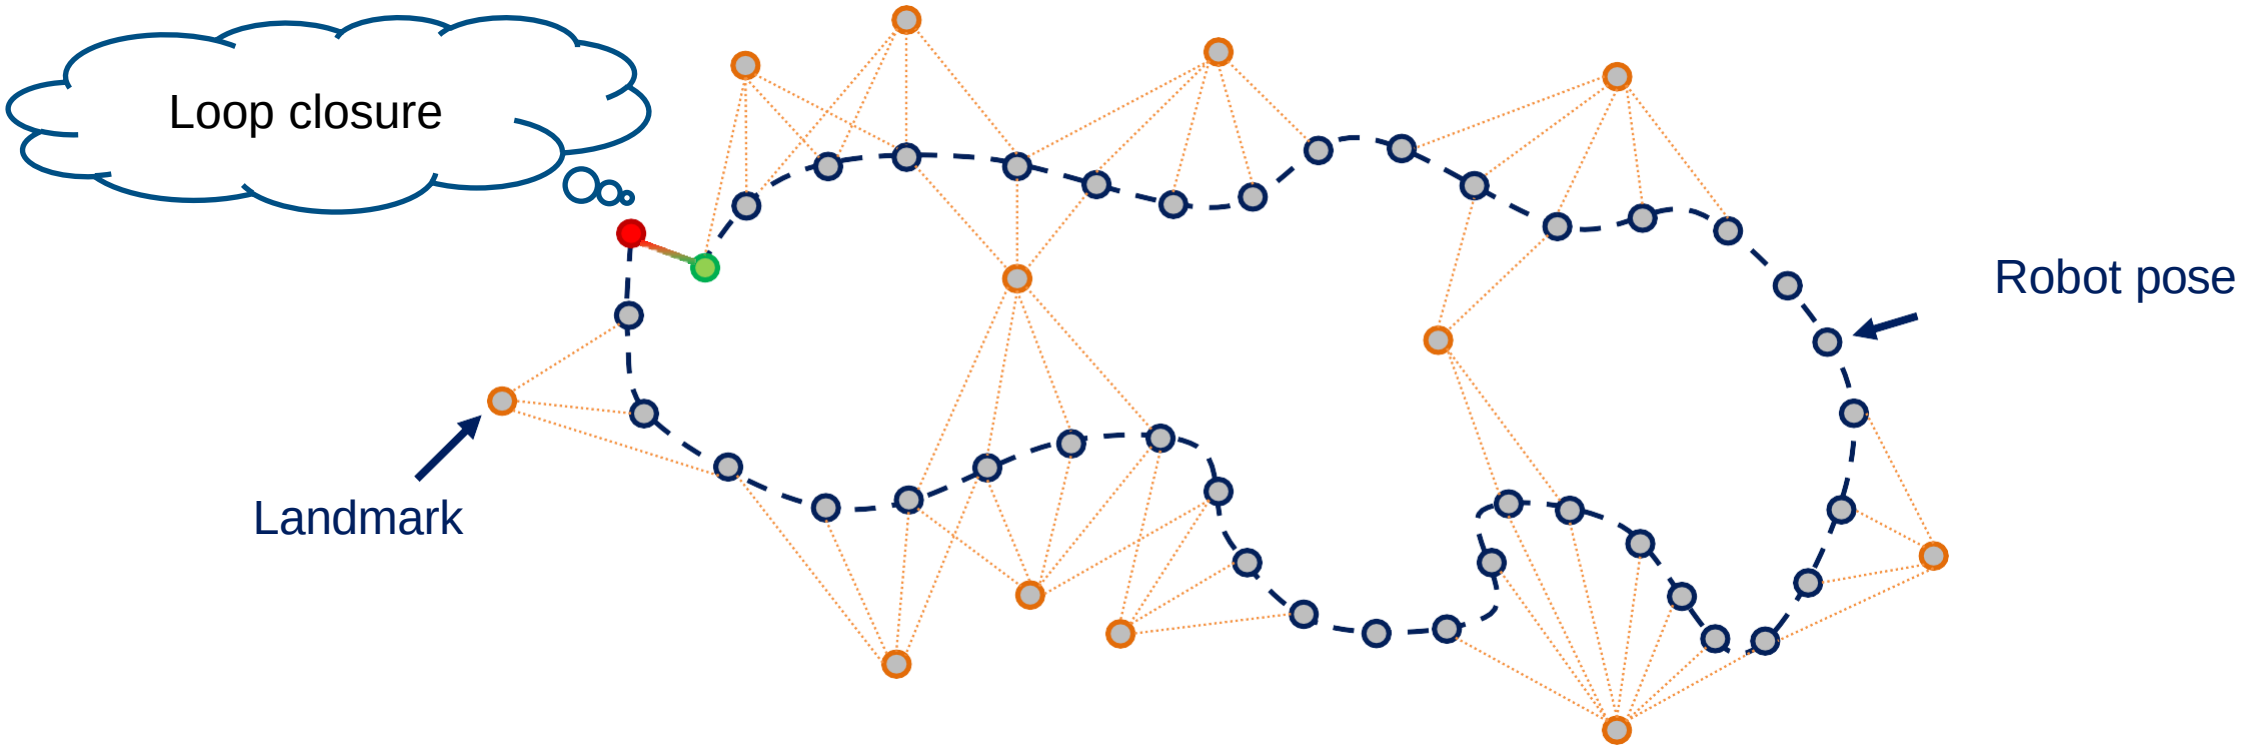
$$argmin \sum_{i=u_i} \|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2$$



Graph SLAM

The (Gaussian) Full SLAM problem becomes

$$argmin \sum_{i=u_i} \|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2$$

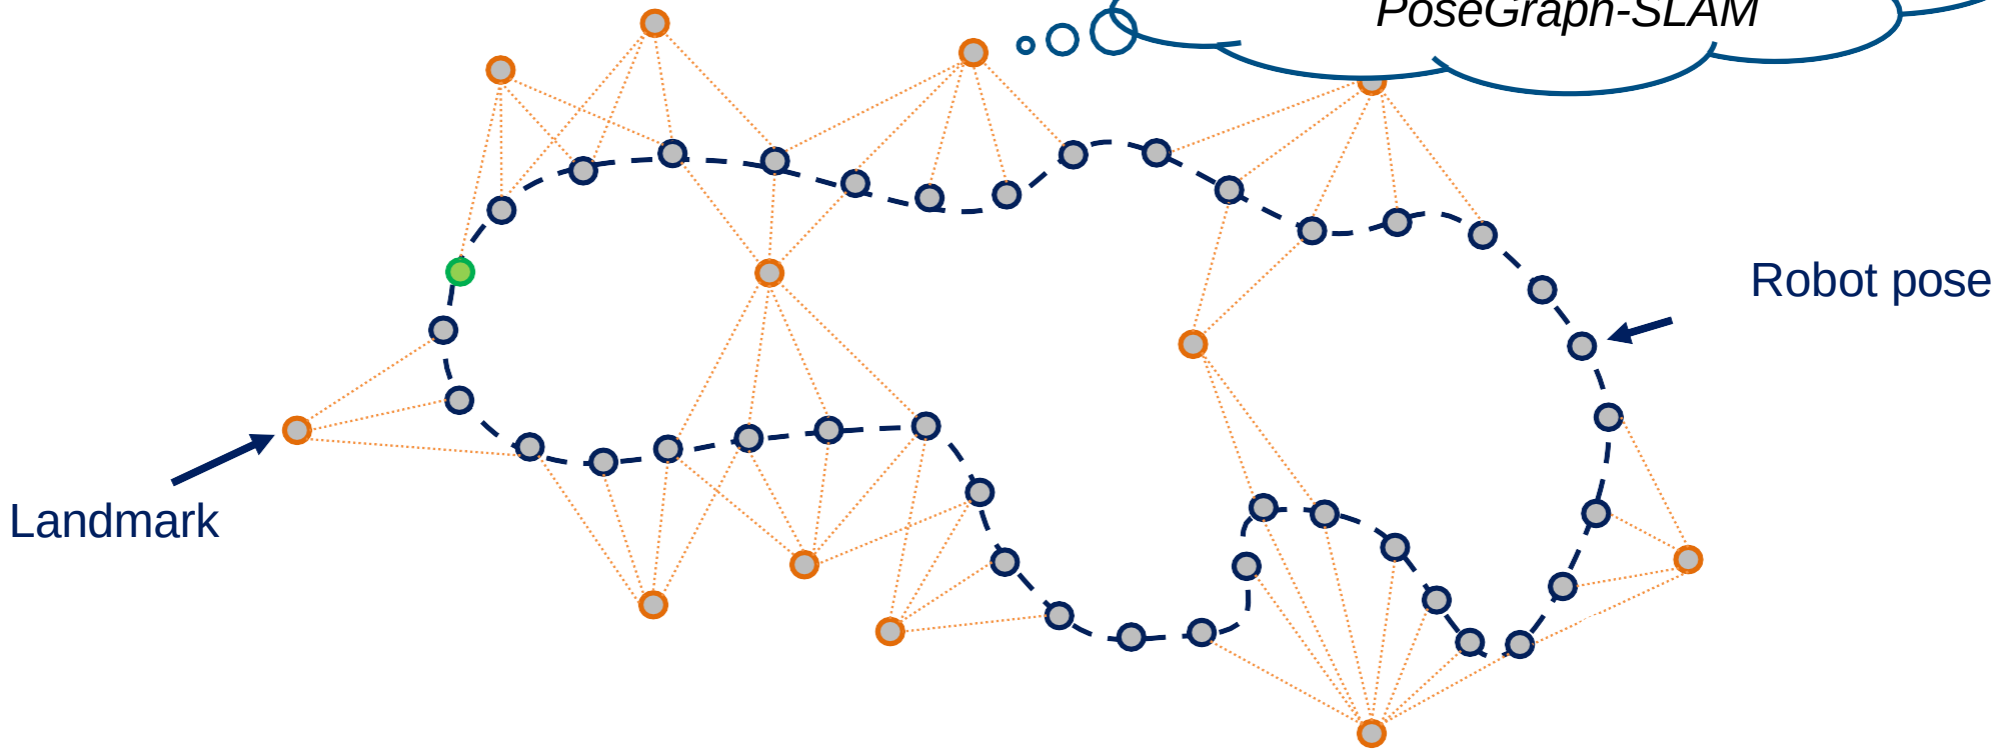


Graph SLAM

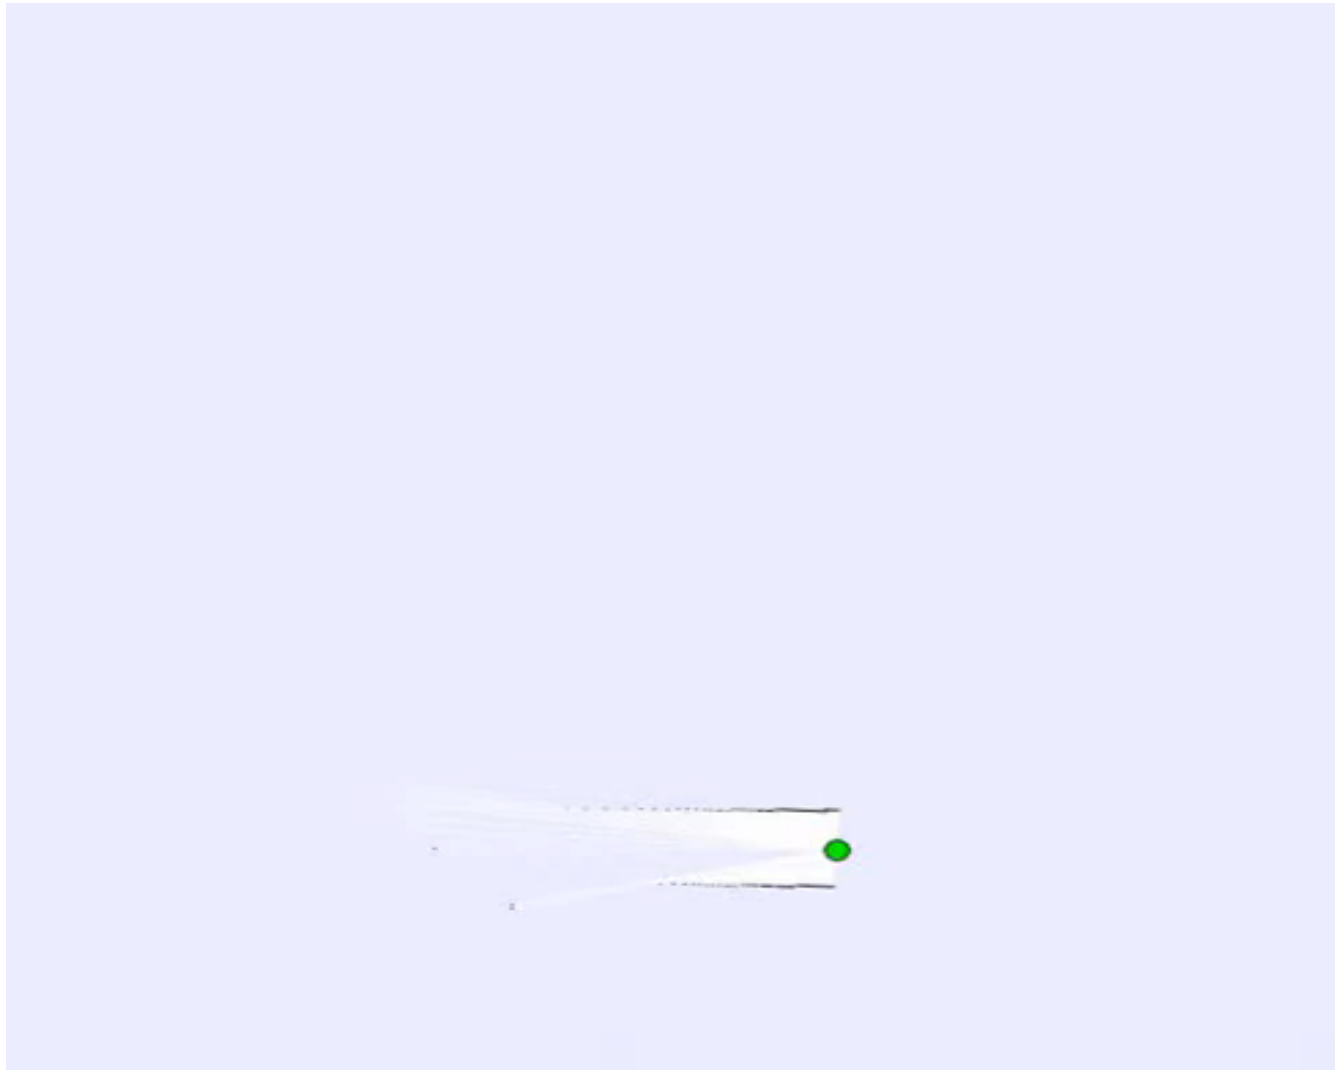
The (Gaussian) Full SLAM problem becomes

$$argmin \sum_{i=u_i} \|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum$$

Sometimes landmarks get «attached» to poses in *PoseGraph-SLAM*



Graph-SLAM Example



What did happen to the quadratic complexity?

Solving non-linear least squares needs iterative adjustments (gradient descend)

$$argmin \sum_{i=u_i} \|g(\Gamma_{i-1}, u_i) - \Gamma_i\|_R^2 + \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2$$

Let's focus on measurement factors, then the following extends to all factors

$$h_i(\Gamma_i, L_i) = h_i(X_i) = h_i\left(X_i^0 + \Delta_i\right) \approx h_i\left(X_i^0\right) + H_i\Delta_i$$

$$\Delta_i = X_i - X_i^0 \qquad H_i = \left.\frac{\partial h_i(X_i)}{\partial X_i}\right|_{X_i^0}$$

This is the usual Taylor expansion

We look for the single adjustment step which minimizes all measurement factors

$$\Delta^* = argmin \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2 = argmin \sum_{i=z_i} \|H_i\Delta_i - (z_i - h_i(X_i^0))\|_Q^2$$

What did happen to the quadratic complexity?

$$\Delta^* = argmin \sum_{i=z_i} \|h(\Gamma_i, L_i) - z_i\|_Q^2 = argmin \sum_{i=z_i} \|\underbrace{H_i\Delta_i - (z_i - h_i(X_i^0))}_{e_i}\|_Q^2$$

We can rewrite the Mahalanobis norm as it follows turning it into quadratic

$$\|e_i\|_Q^2 \equiv e_i^T Q^{-1} e_i = \left(Q^{-1/2} e_i\right)^T \left(Q^{-1/2} e_i\right) = \left\|Q^{-1/2} e_i\right\|_2^2$$

$$\Delta^* = argmin \sum_{i=z_i} \|Q^{-1/2} H_i \Delta_i - Q^{-1/2}(z_i - h_i(X_i^0))\|_2^2$$

From this we can get to

$$\Delta^* = argmin \sum_{i=z_i} \|A_i\Delta_i - b_i\|_2^2 = argmin \|A\Delta - b\|_2^2$$

$$A_i = Q_i^{-1/2} H_i \qquad b_i = Q^{-1/2}\left(z_i - h_i\left(X_i^0\right)\right)$$

Linear least squares problem

Let's assume odometry included now on

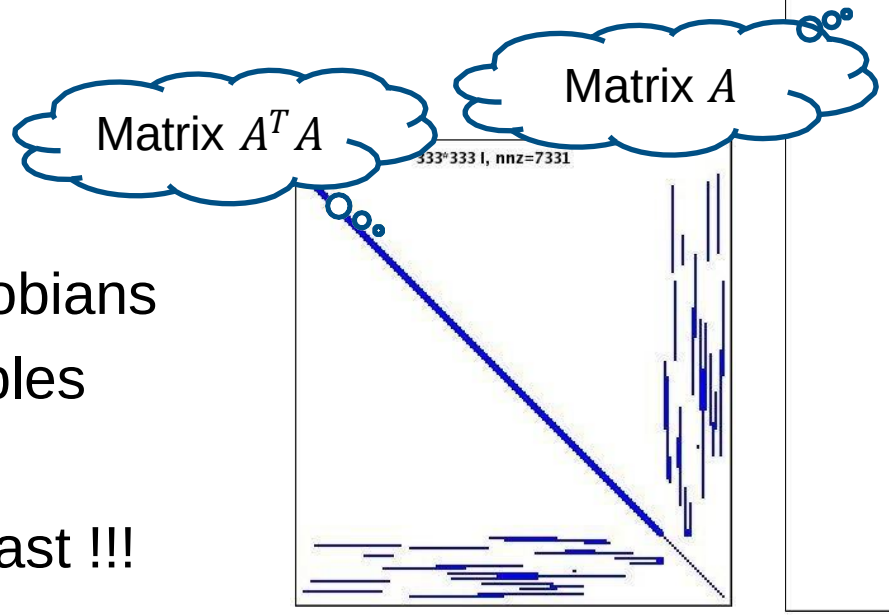
What did happen to the quadratic complexity?

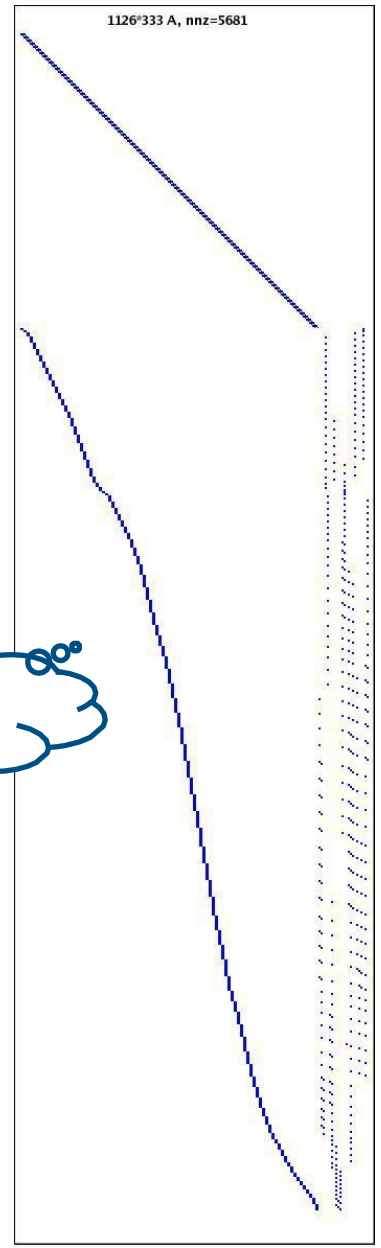
$$\Delta^* = argmin \sum_{i=z_i} \|A_i \Delta_i - b_i\|_2^2 = argmin \|A\Delta - b\|_2^2$$

Let's solve the linear least squares problem

$$\|A\Delta - b\|_2^2 = (A\Delta - b)^{\mathrm{T}}(A\Delta - b) = \Delta^T A^T A\Delta - 2\Delta^T A^T b + bb^T$$

$$\frac{\partial \|A\Delta - b\|_2^2}{\partial \Delta} = 0 \quad \Rightarrow \quad A^T A\Delta = A^T b$$





Matrix A from Odometry and Measurement Jacobians

- Factors are constraints between 2 variables
- Matrix A is sparse and matrix $A^T A$ too
- We can use sparse methods which are fast !!!

What did happen to the quadratic complexity?

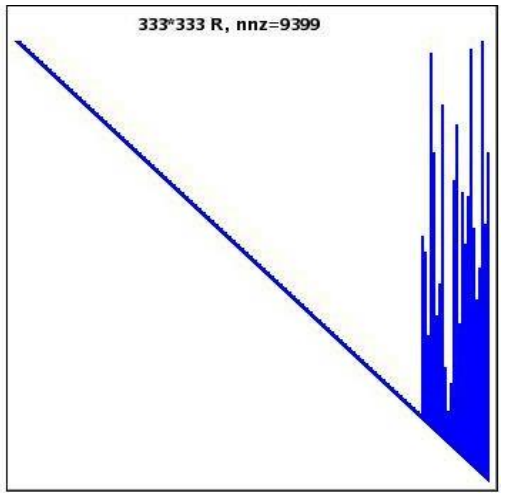
$$\frac{\partial \|A\Delta - b\|_2^2}{\partial \Delta} = 0 \quad \Rightarrow \quad A^T A\Delta = A^T b$$

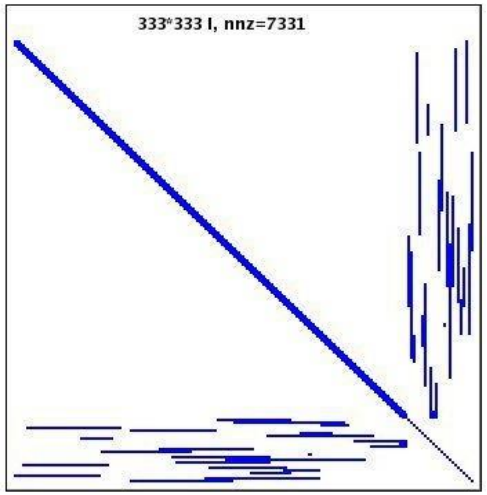
Naïve least squares uses pseudo inverse, however $(A^T A)^{-1}$ is $O(n^3)$

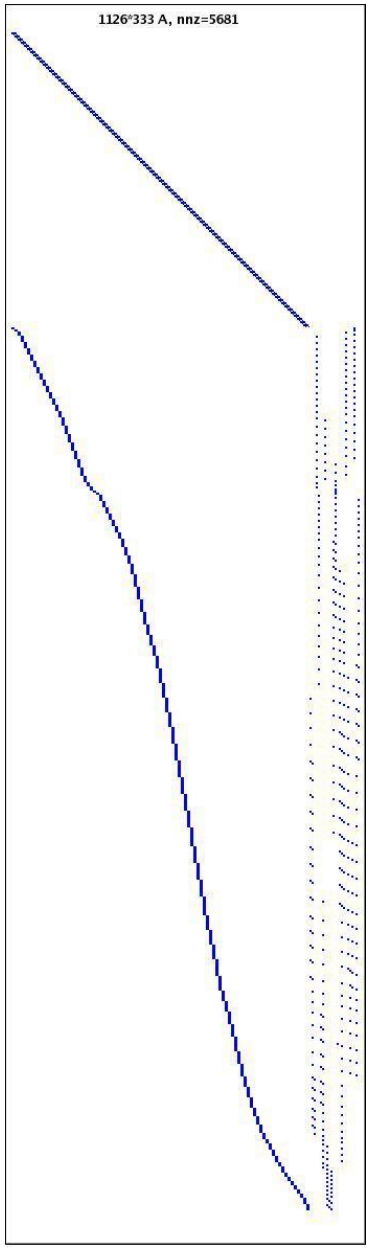
$$\Delta = (A^T A)^{-1} A^T b$$

Cholesky factorization $(A^T A)^{-1} = R^T R$ (R upper triangular) is $O(n^{1.5})$ to $O(n^2)$

$$R^T R\Delta = A^T b$$
$$R^T y = A^T b$$
$$R^T \Delta = y$$







What did happen to the quadratic complexity?

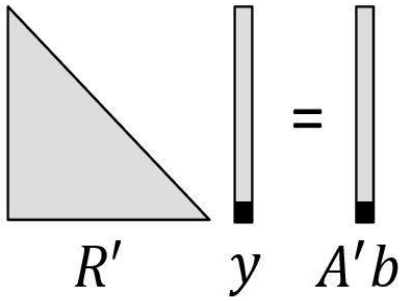
$$\frac{\partial \|A\Delta - b\|_2^2}{\partial \Delta} = 0 \quad \Rightarrow \quad A^T A\Delta = A^T b$$

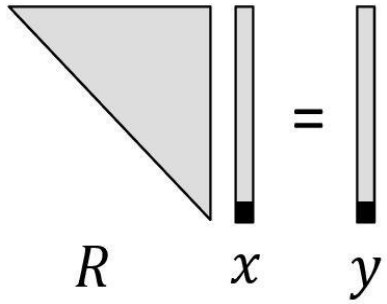
Naïve least squares uses pseudo inverse, however $(A^T A)^{-1}$ is $O(n^3)$

$$\Delta = (A^T A)^{-1} A^T b$$

Cholesky factorization $(A^T A)^{-1} = R^T R$ (R upper triangular) is $O(n^{1.5})$ to $O(n^2)$

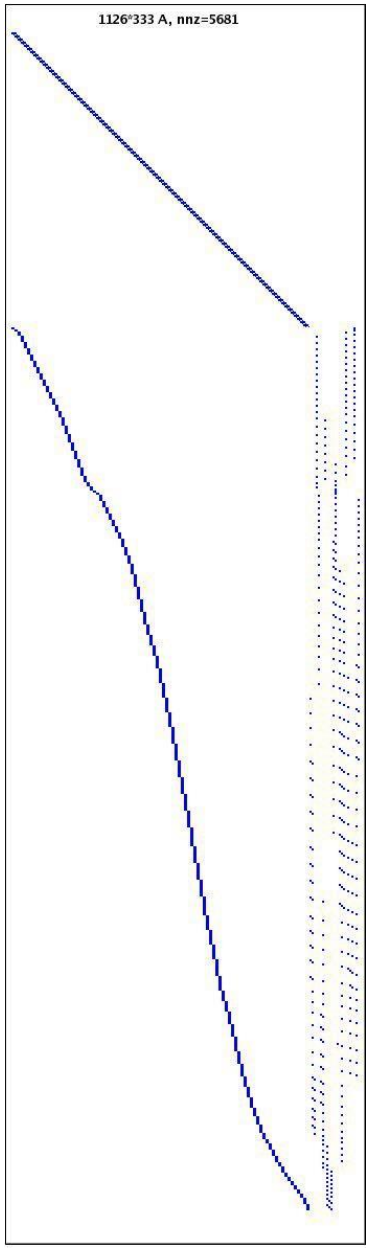
$$R^T R\Delta = A^T b$$
$$R^T y = A^T b$$
$$R^T \Delta = y$$





Solve by forward / backward substitution …

… and via LDL^T decomposition is even faster !!



What did happen to the quadratic complexity?

$$\frac{\partial \|A\Delta - b\|_2^2}{\partial \Delta} = 0 \quad \Rightarrow \quad A^T$$

Naïve least squares uses pseudo inverse, howeve

$$\Delta = (A^T A)^{-1} A^T$$

Cholesky factorization $(A^T A)^{-1} = R^T R$ (R upper tr

$$R^T R\Delta = A^T b$$
$$R^T y = A^T b$$
$$R^T \Delta = y$$
